

... la ville fraîche sous le soleil coupant !

... par Yves Perret
... pour Bâtifrais 2023

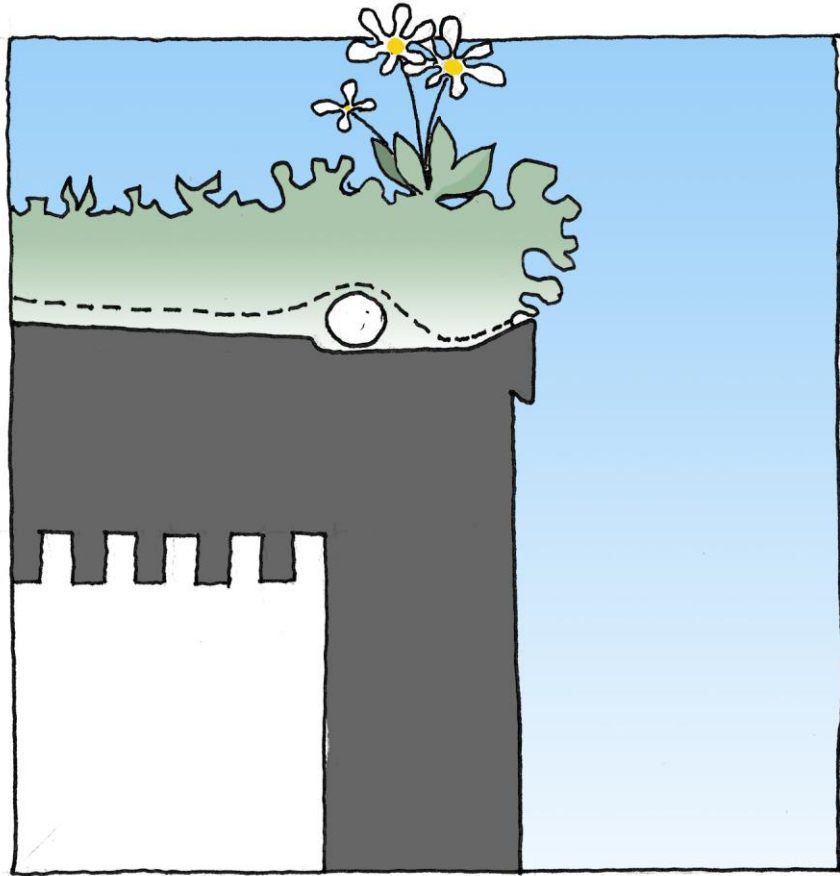

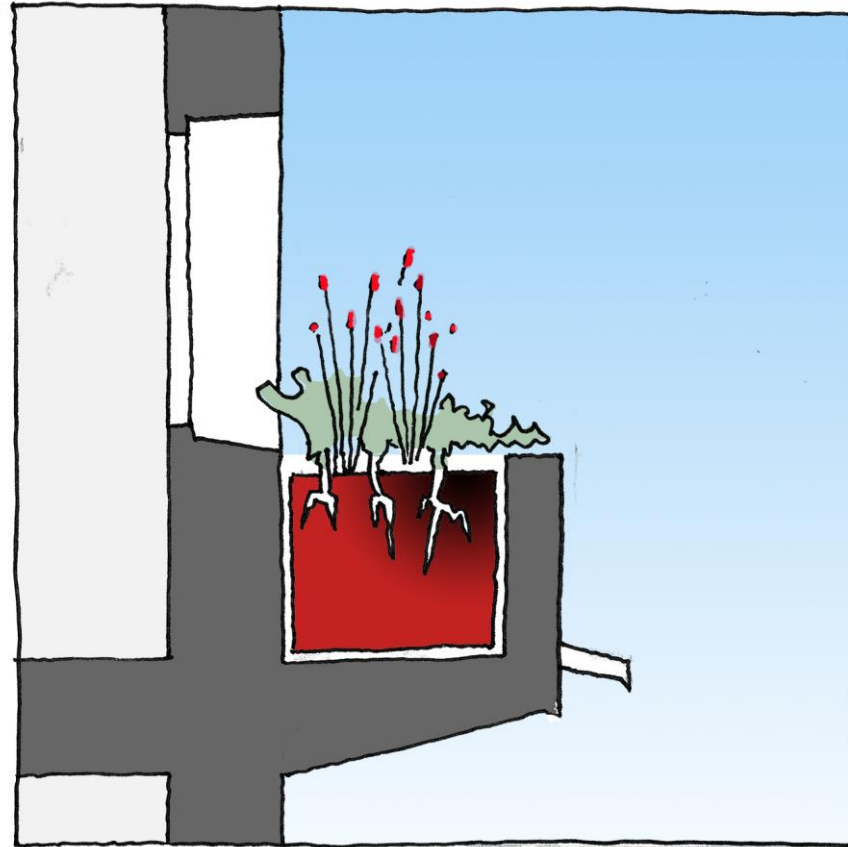

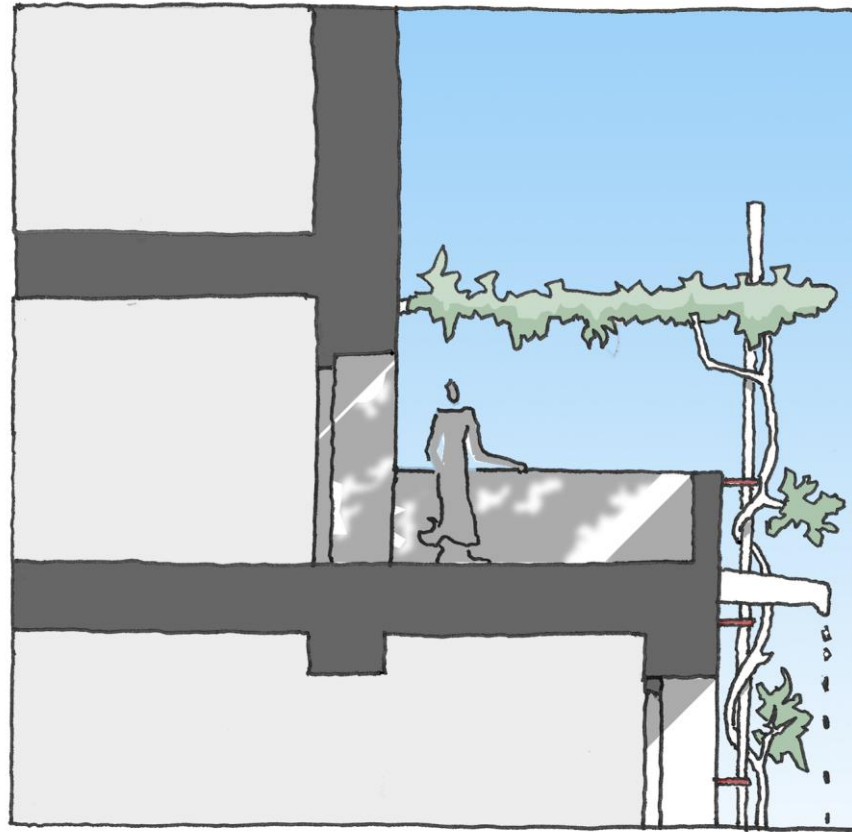

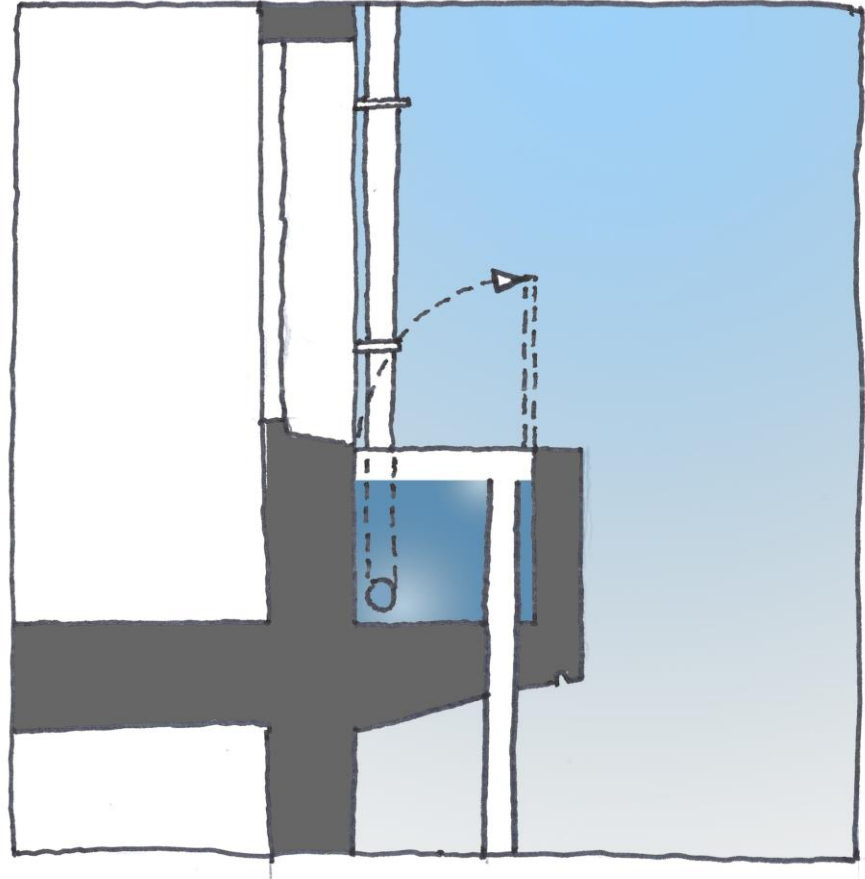

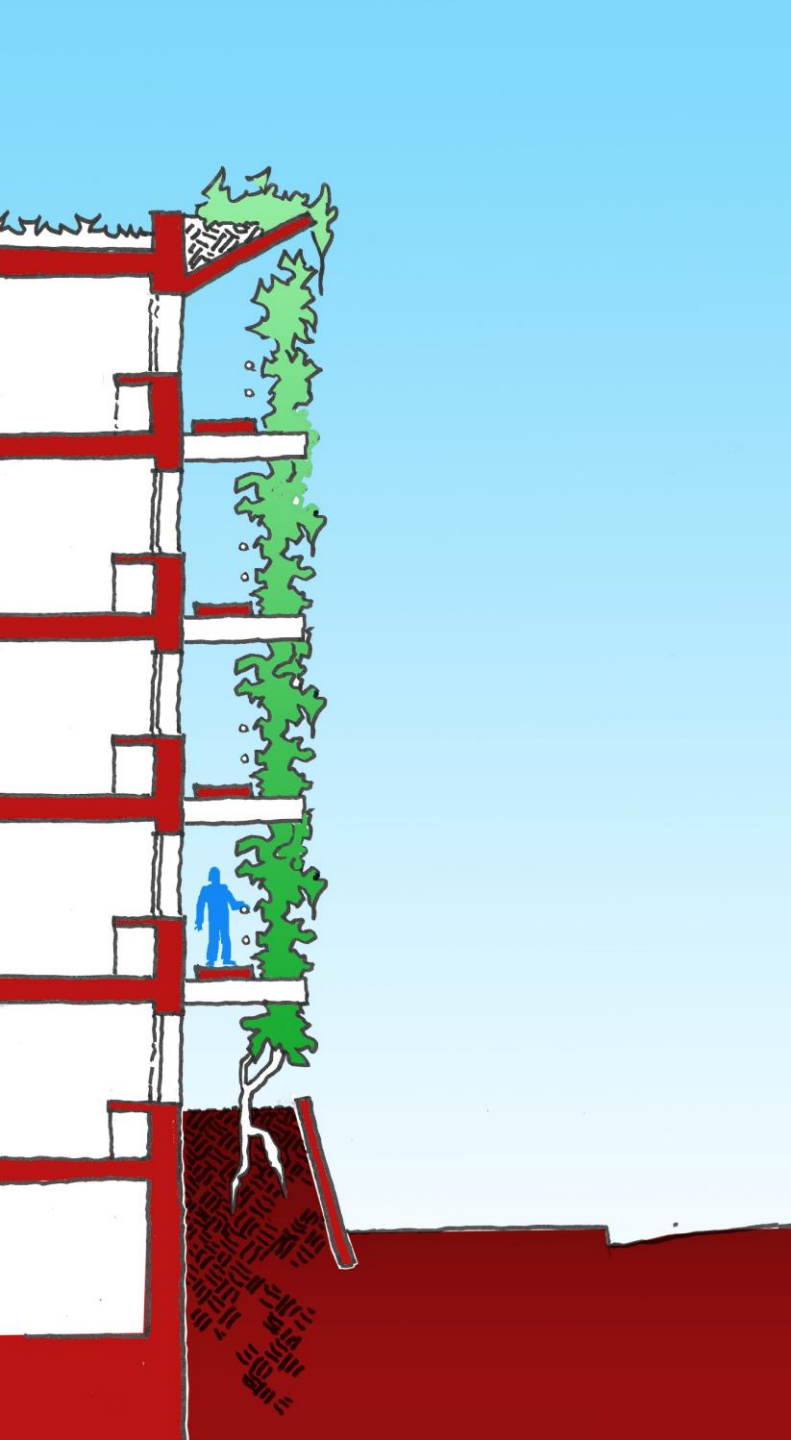

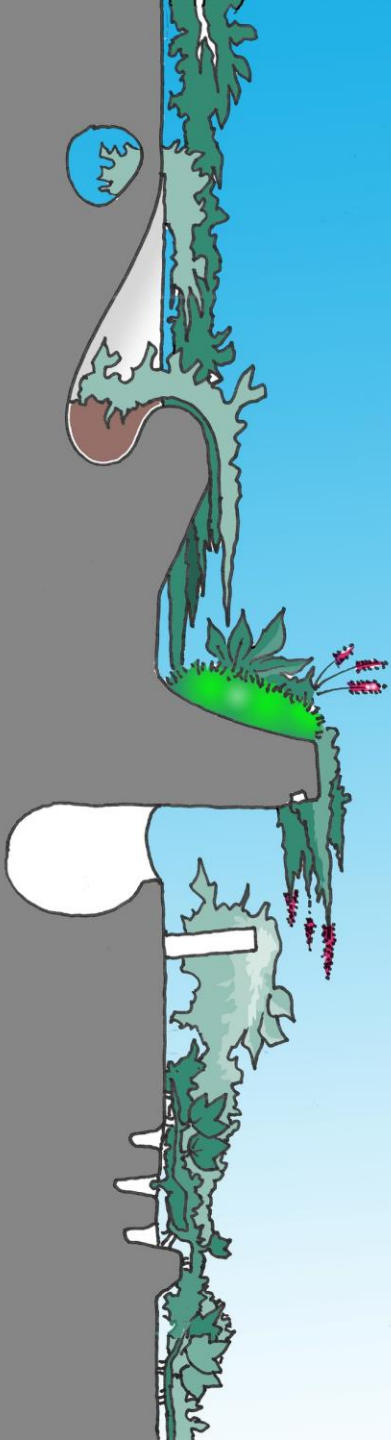

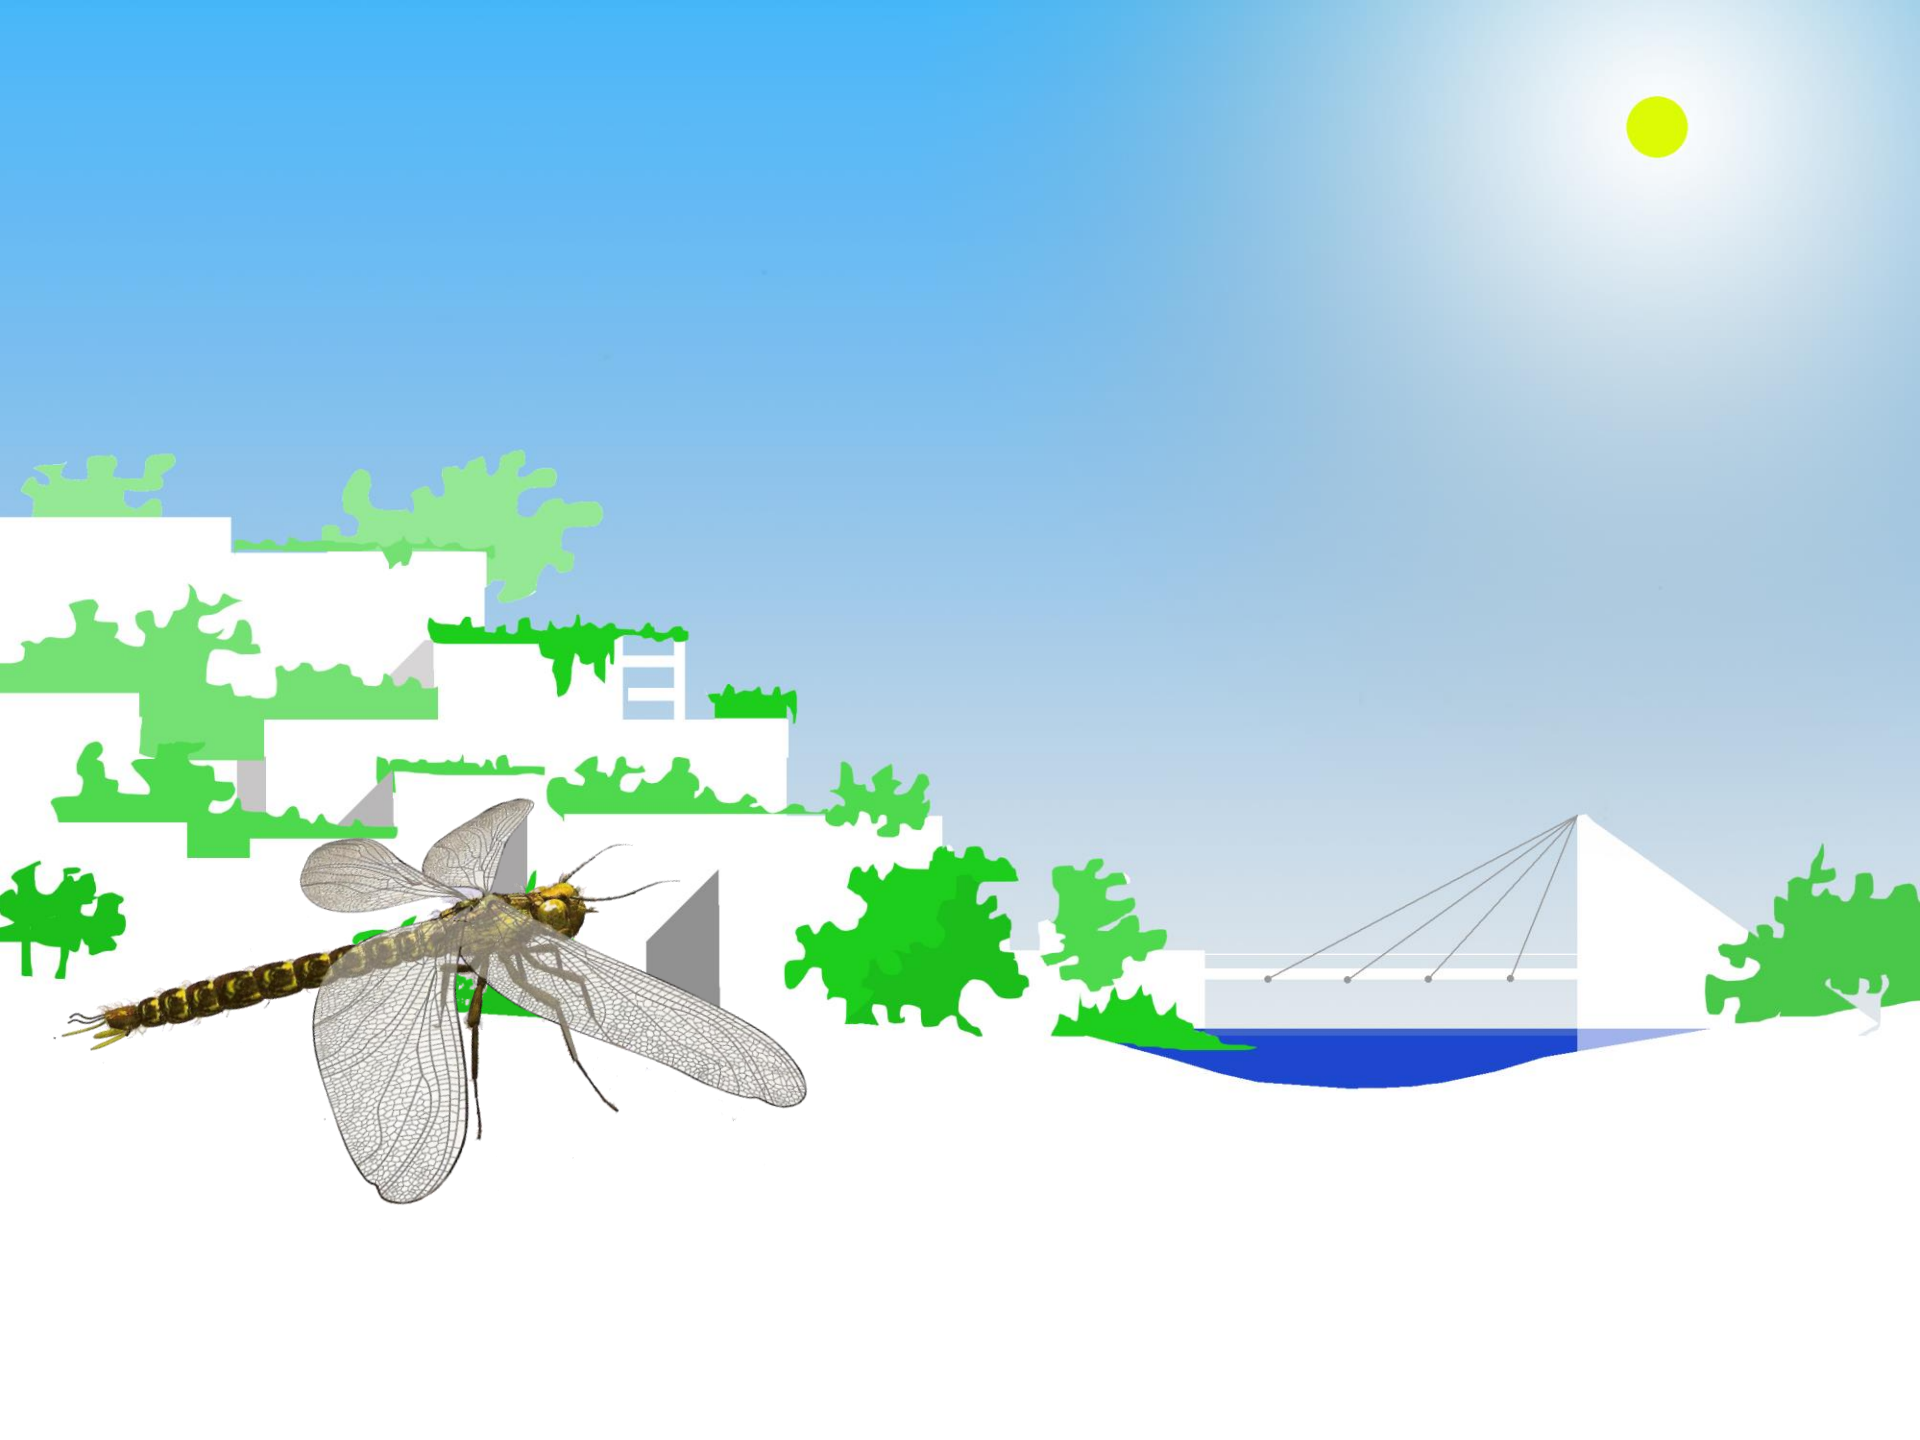

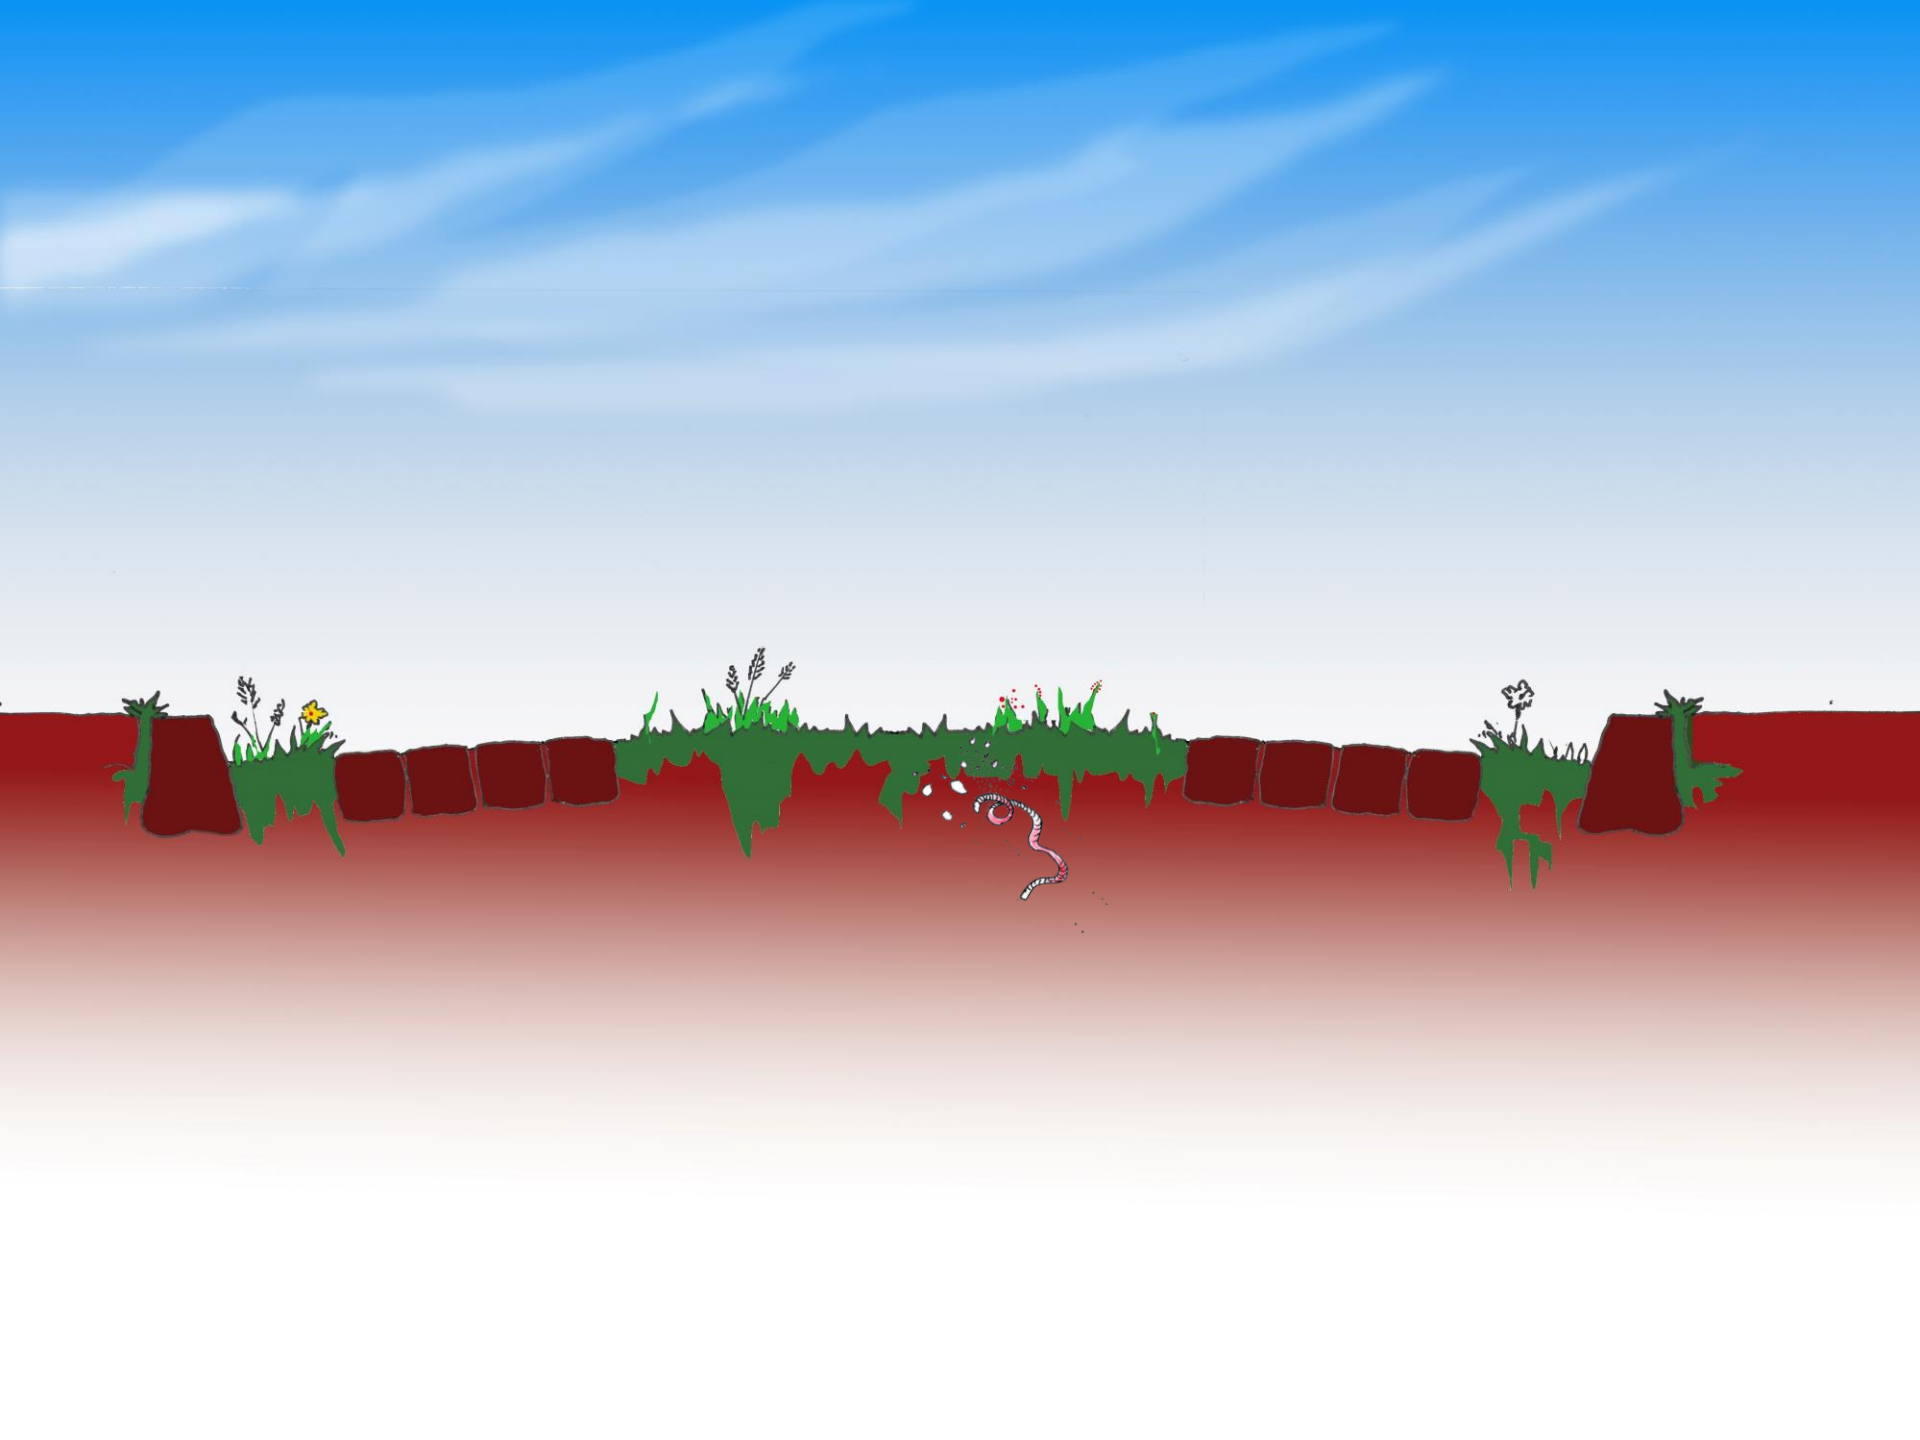

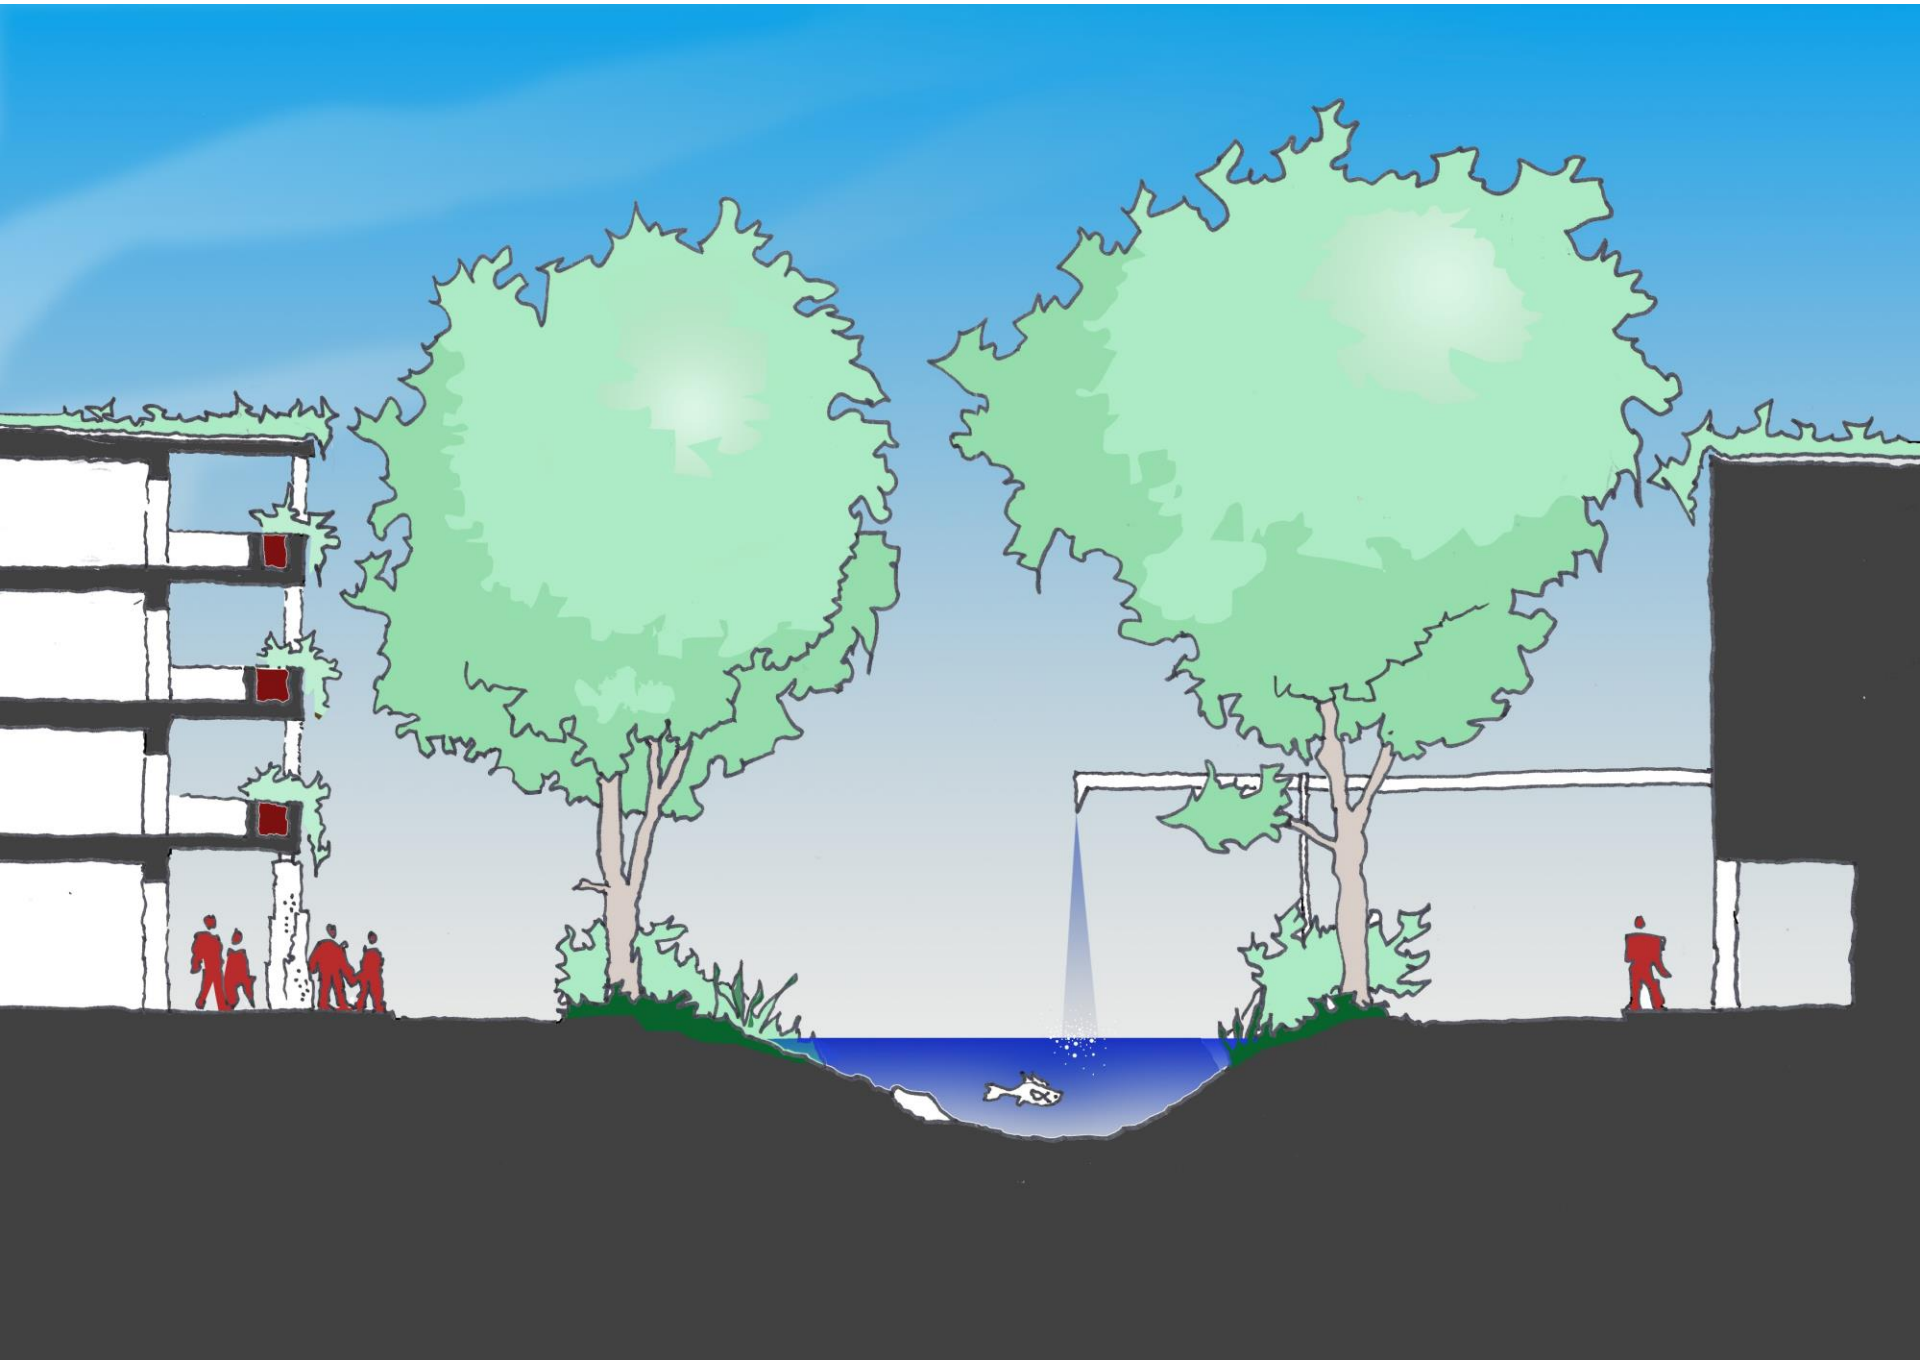

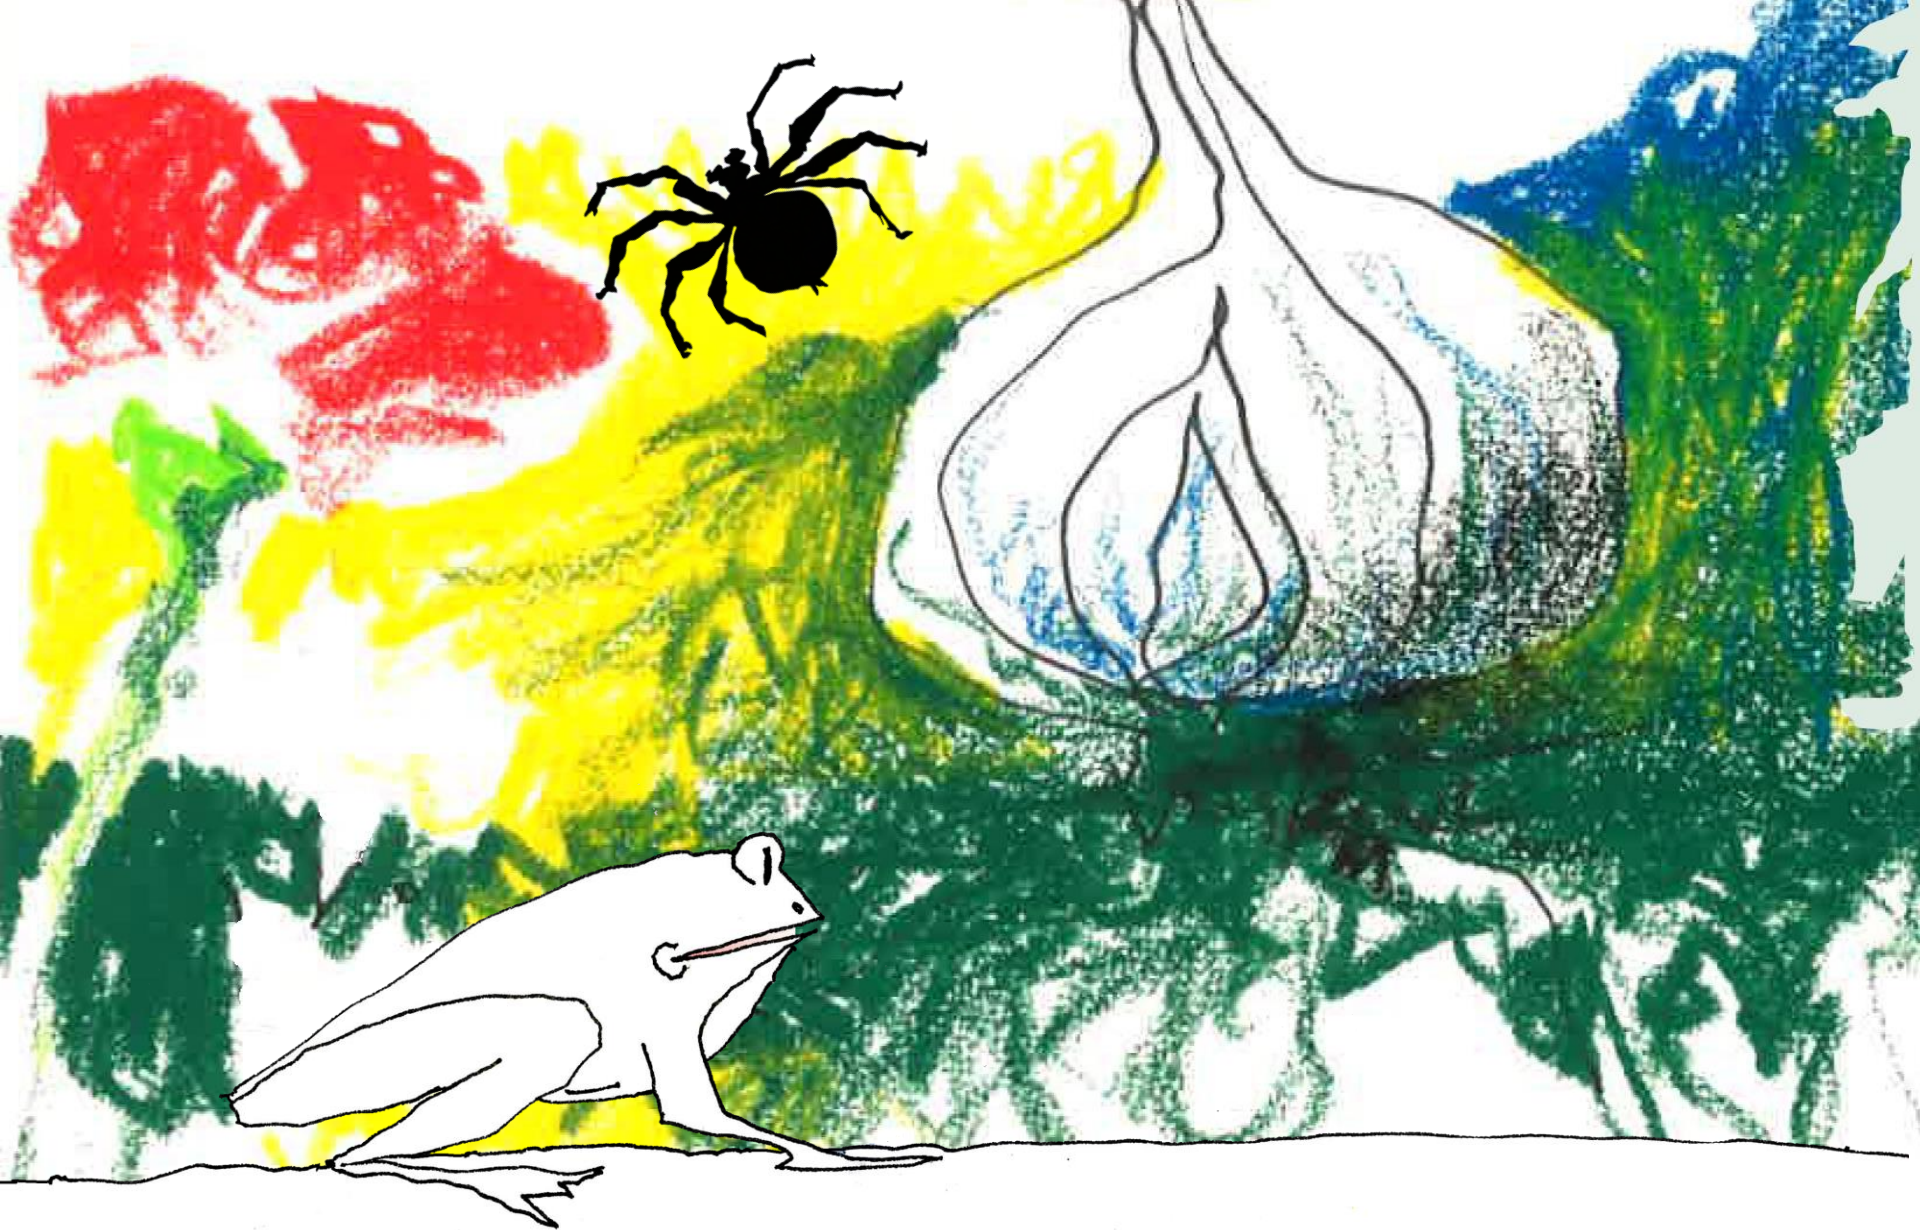

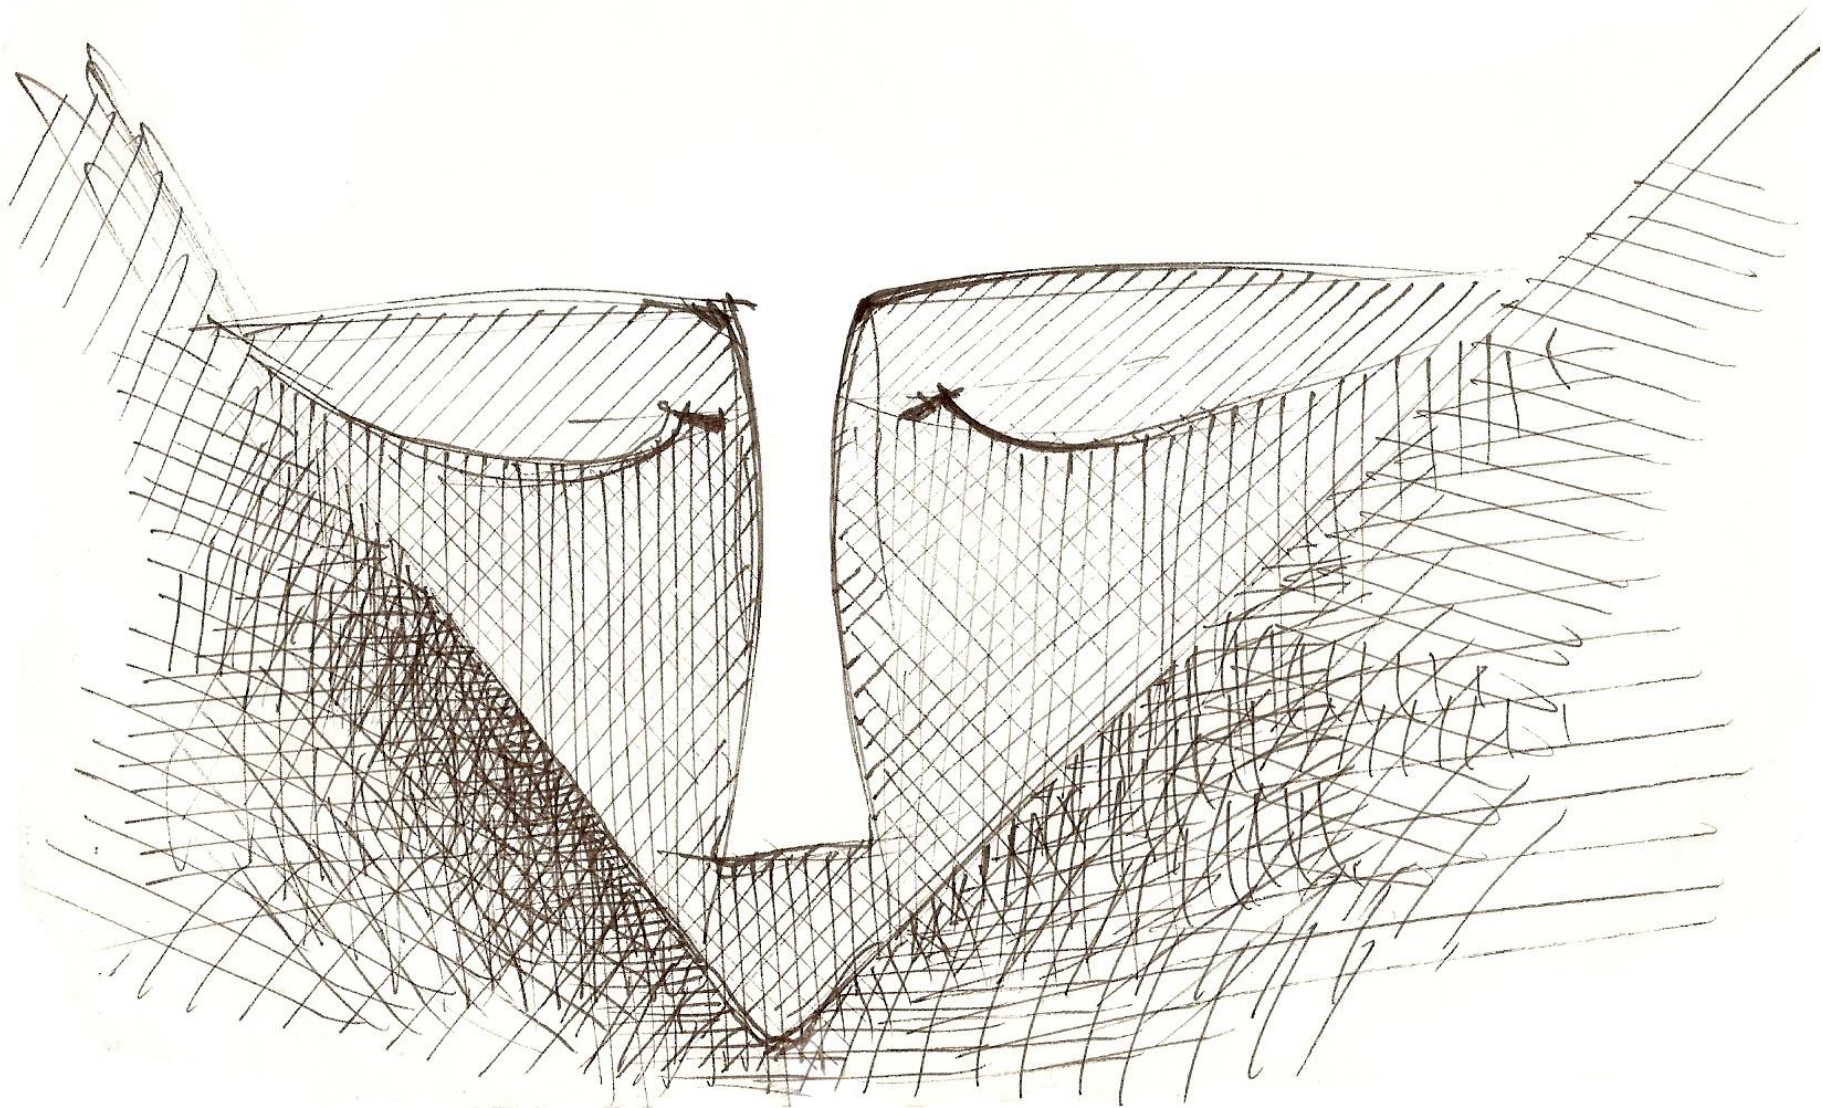

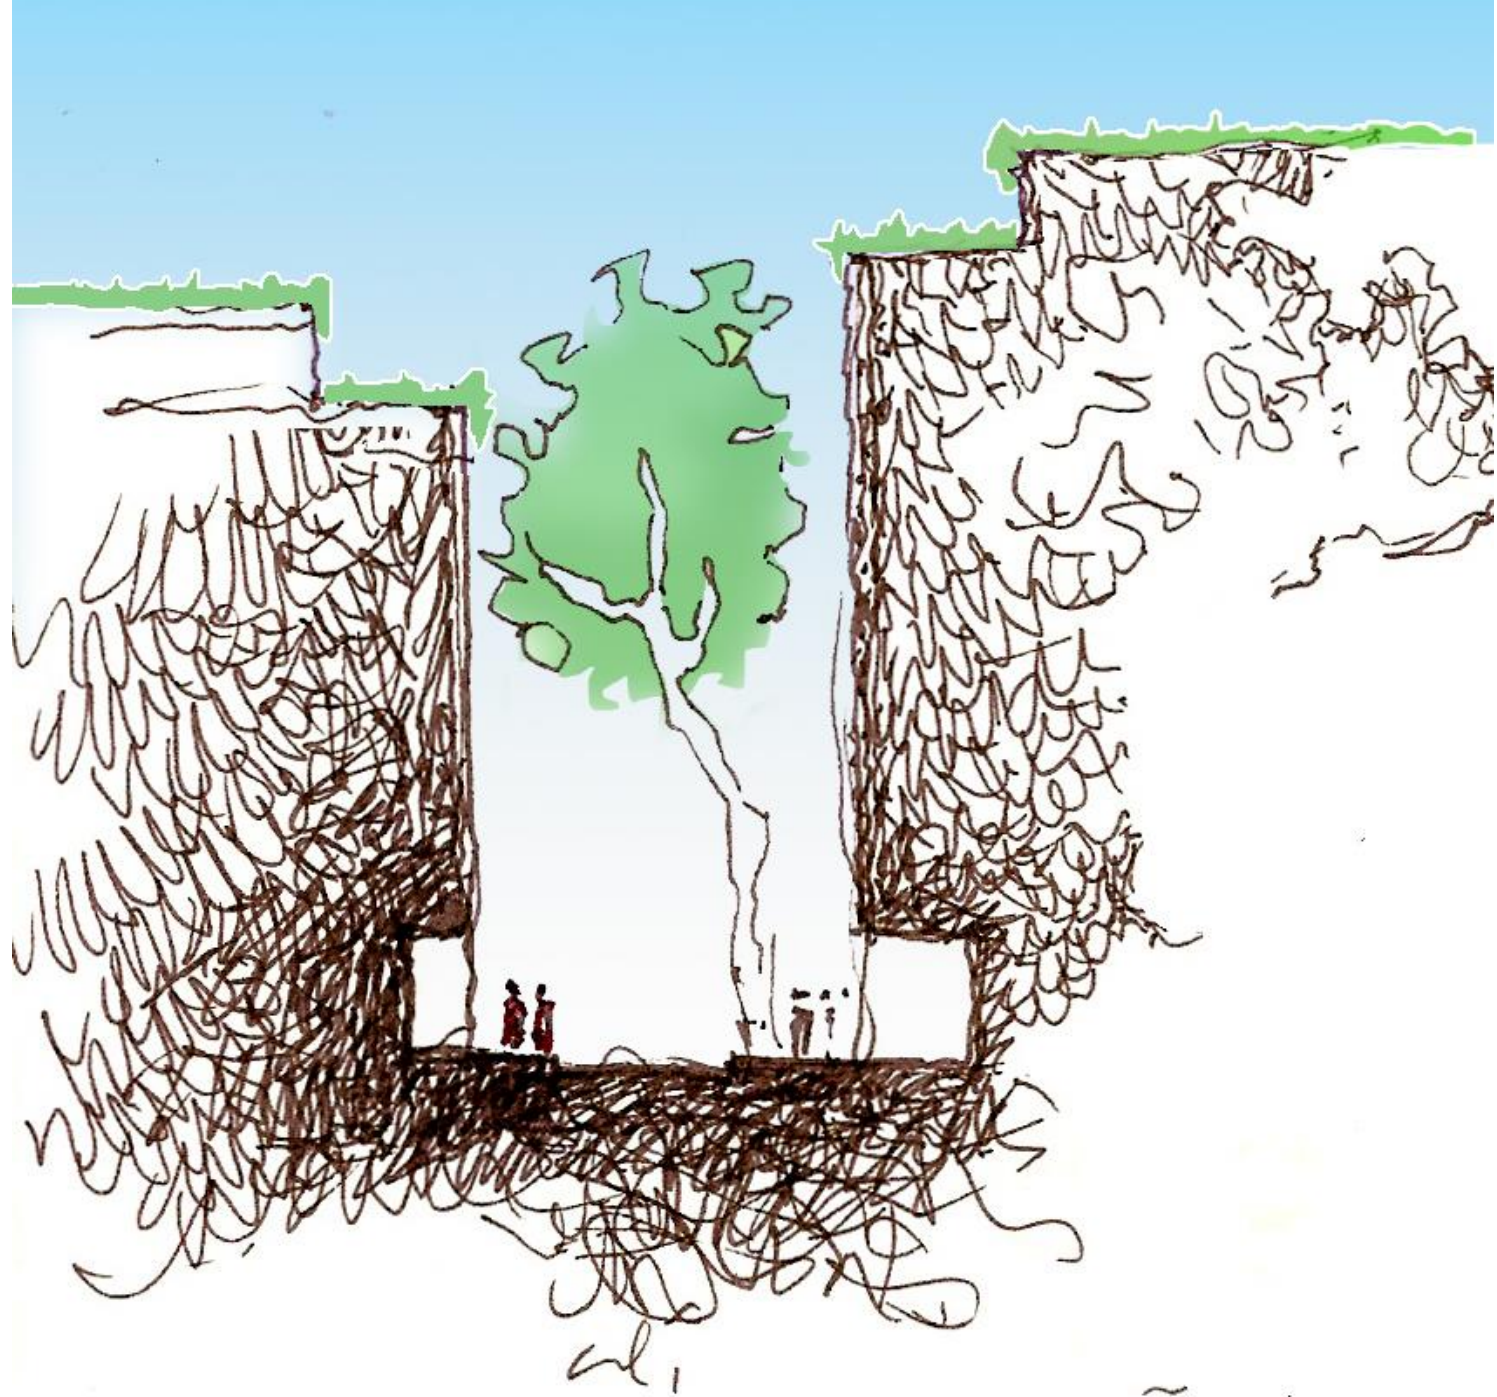

...comme à Grenade...

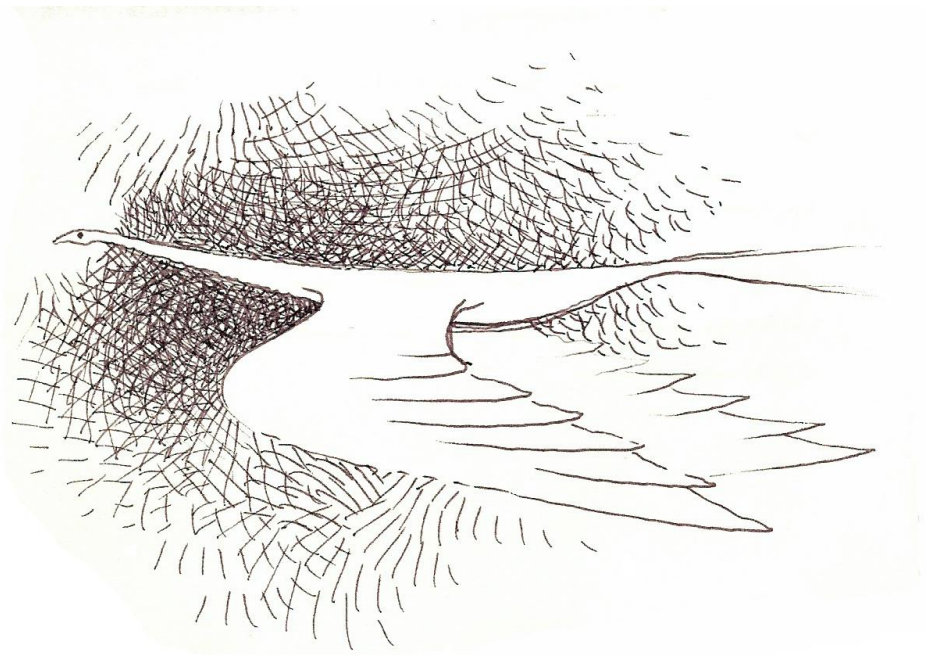

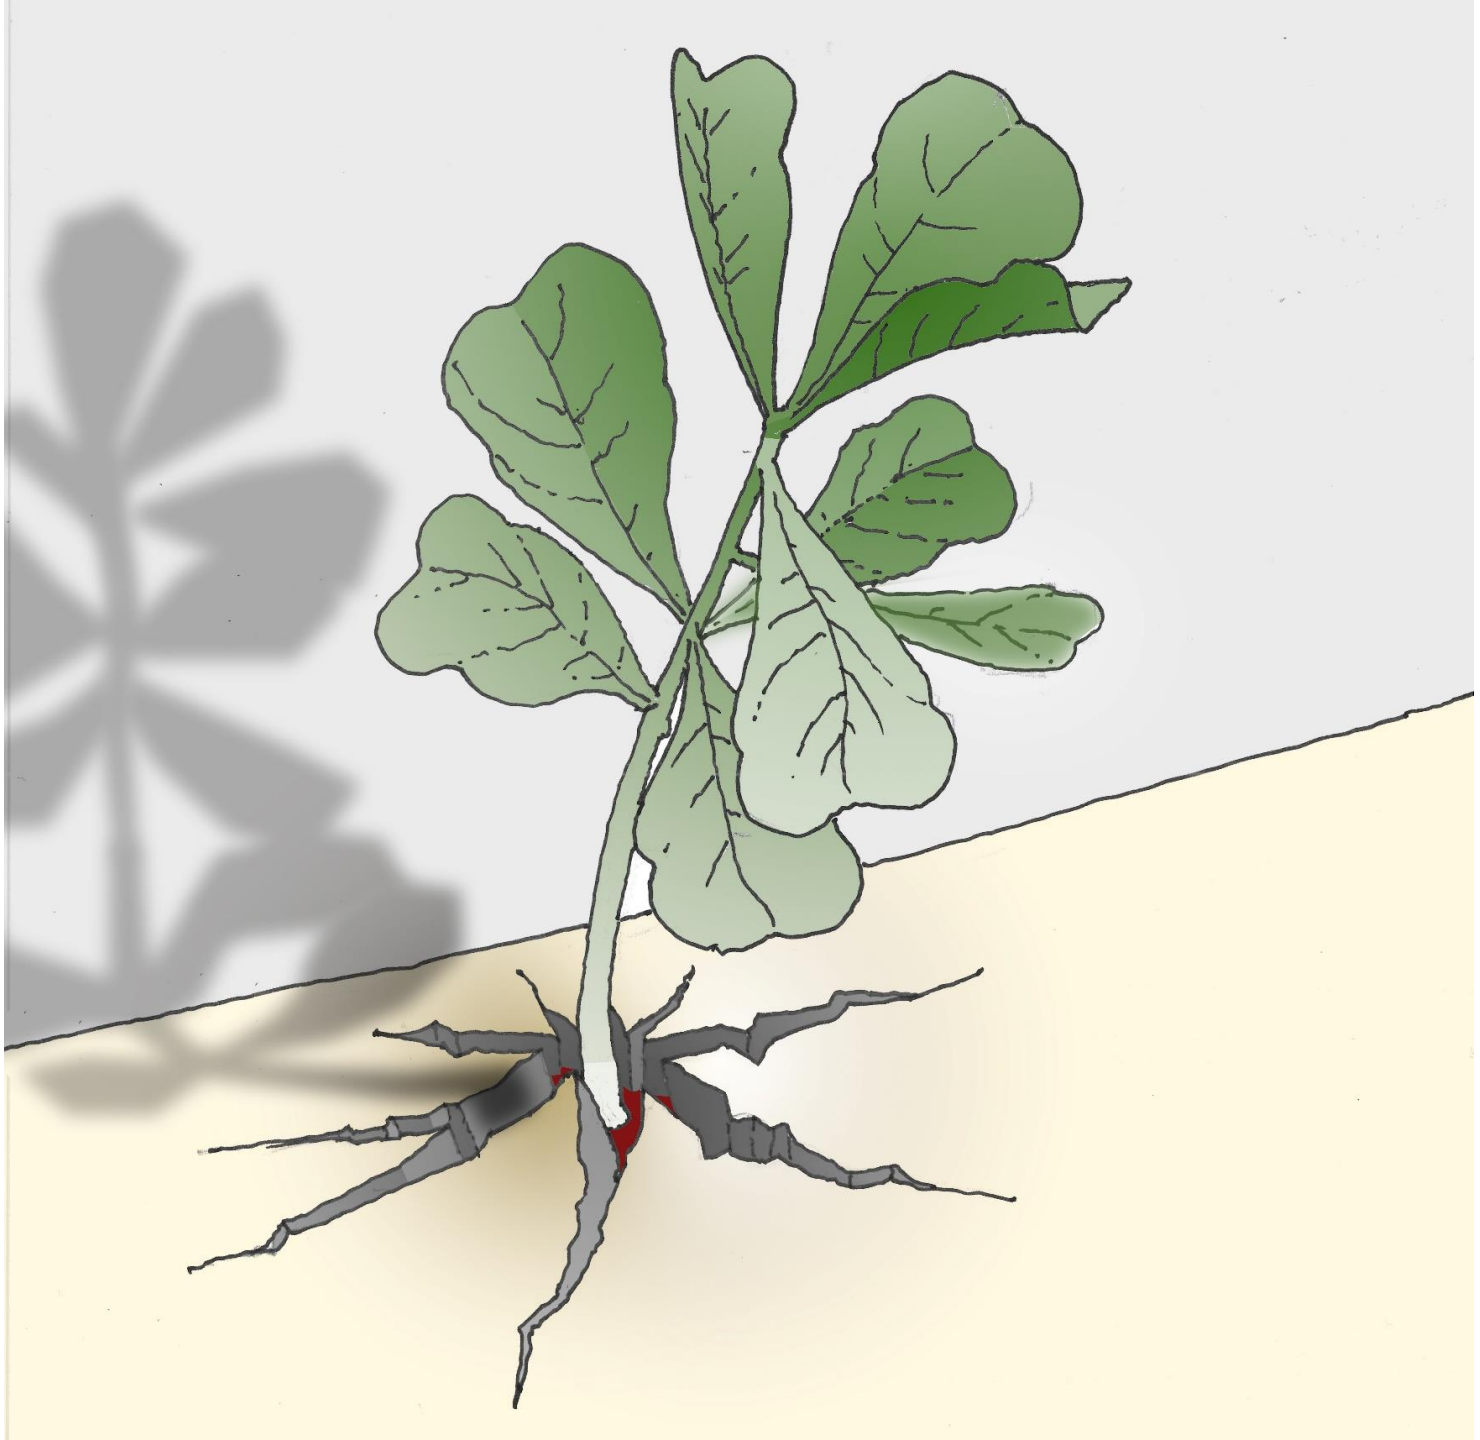

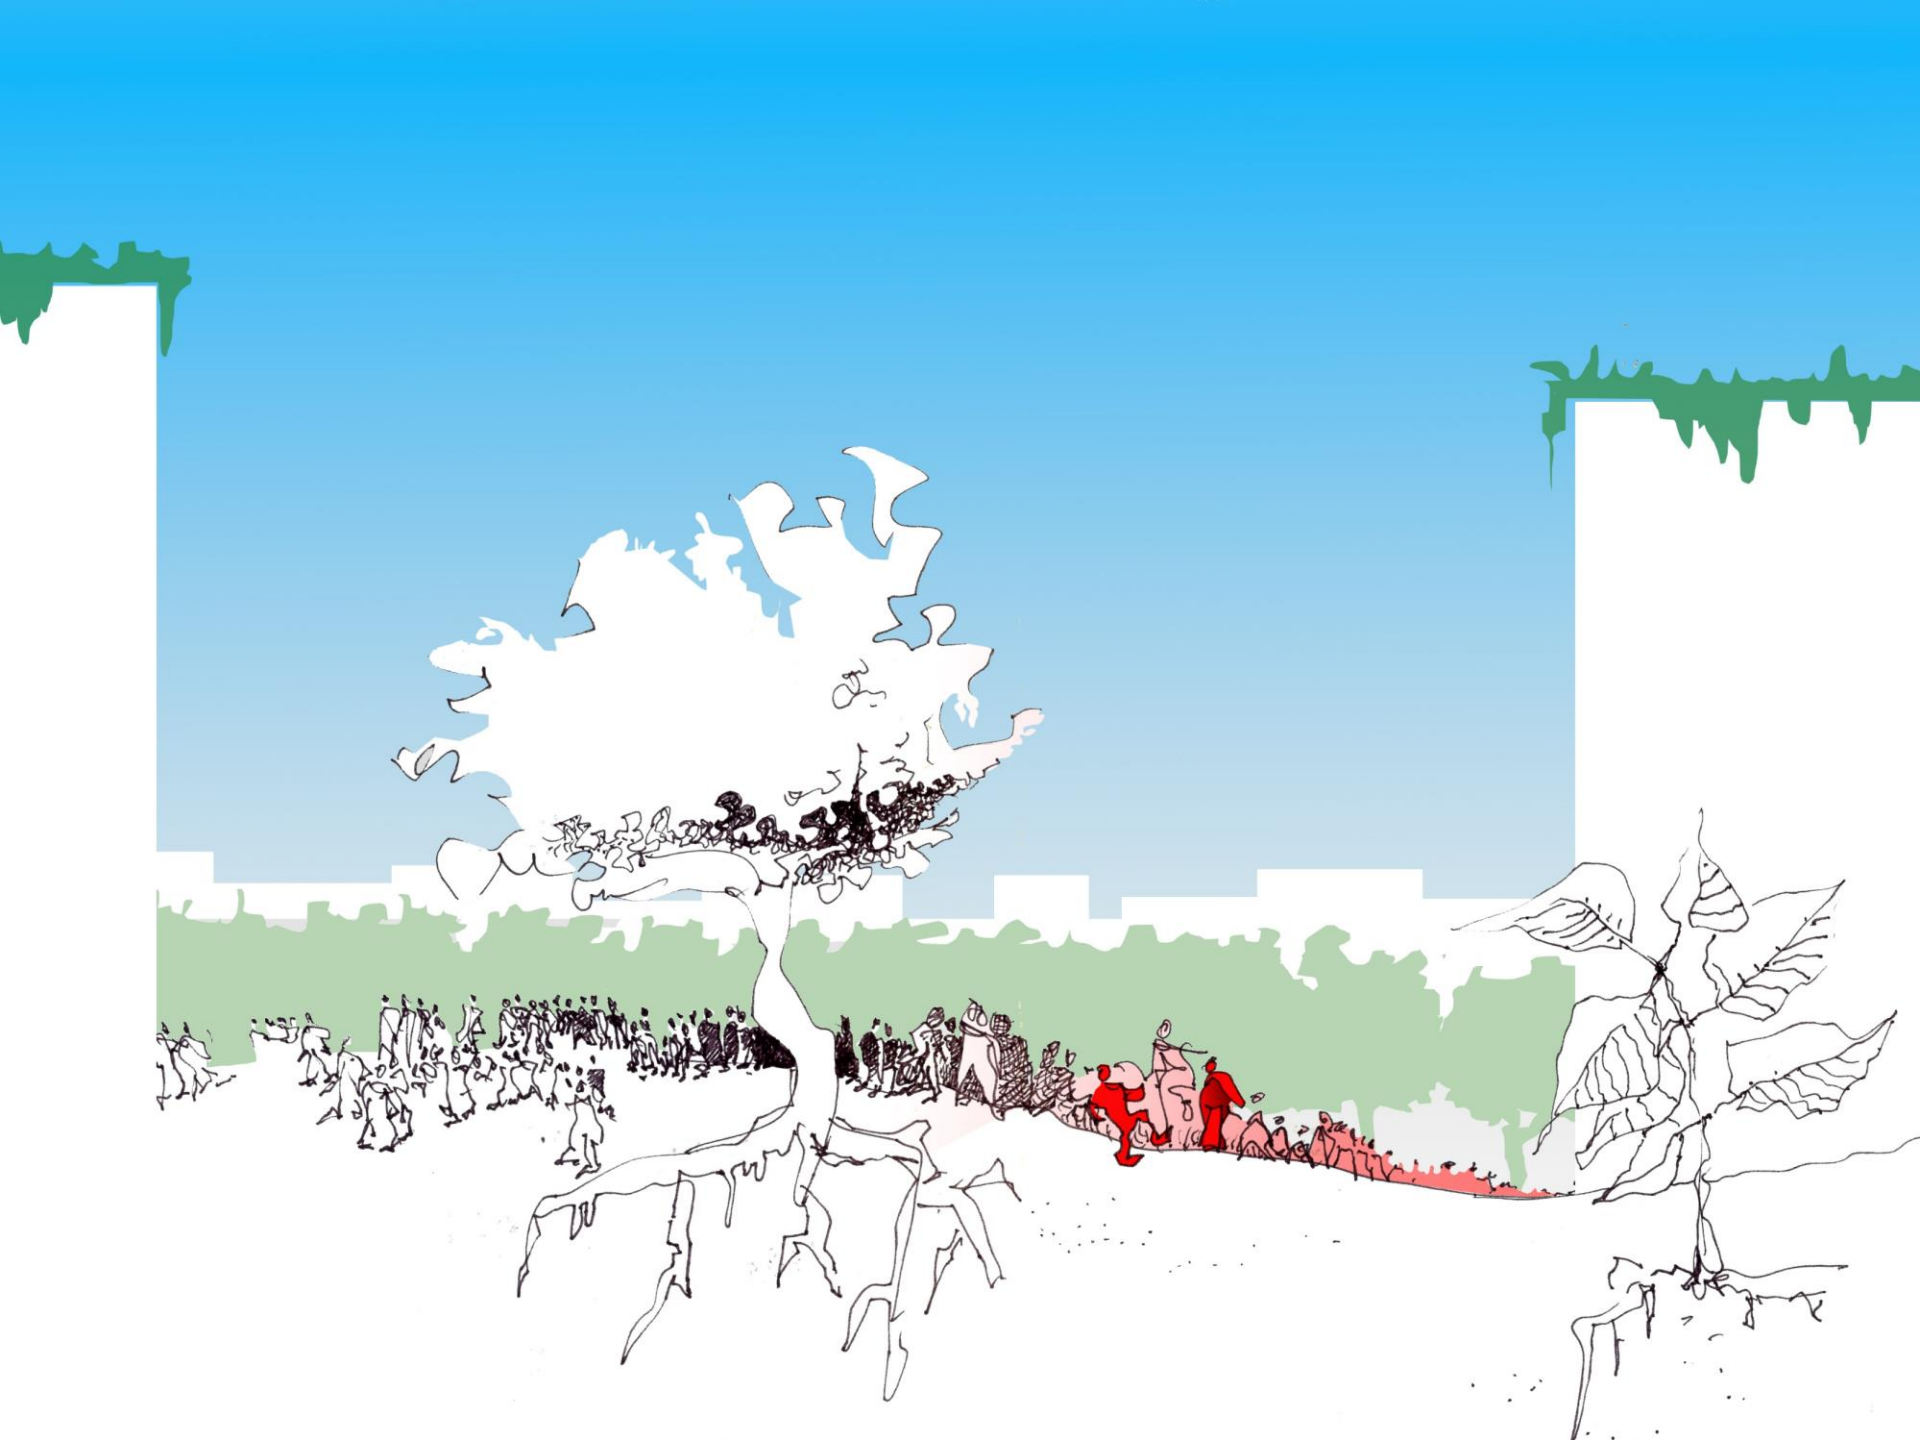

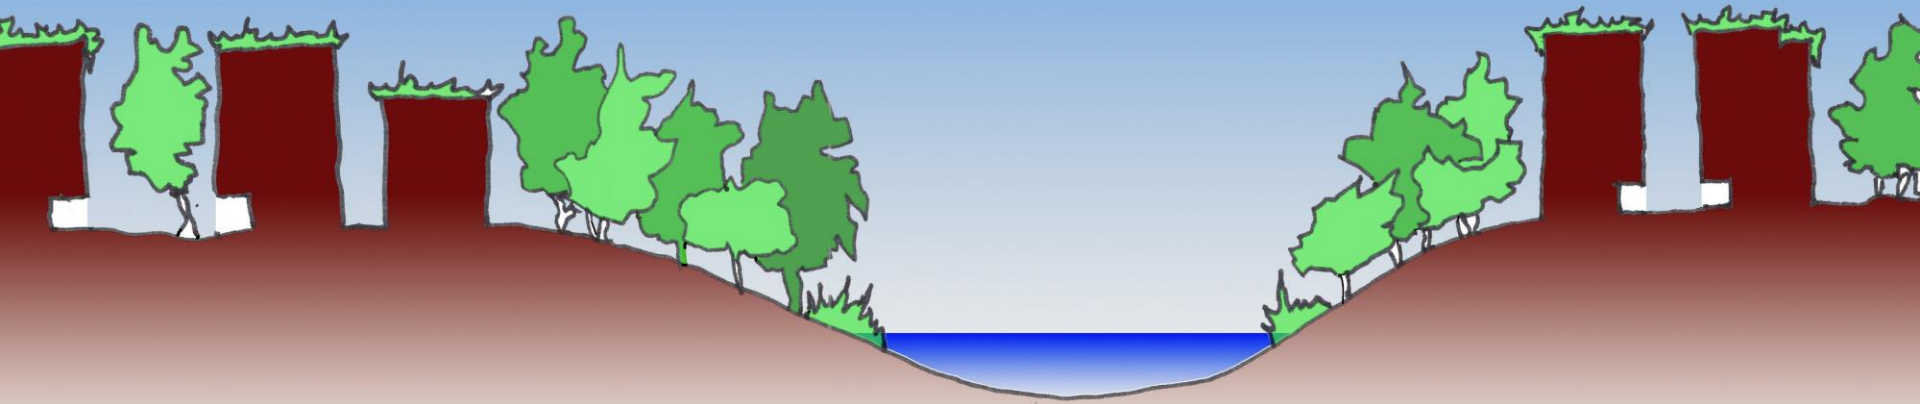

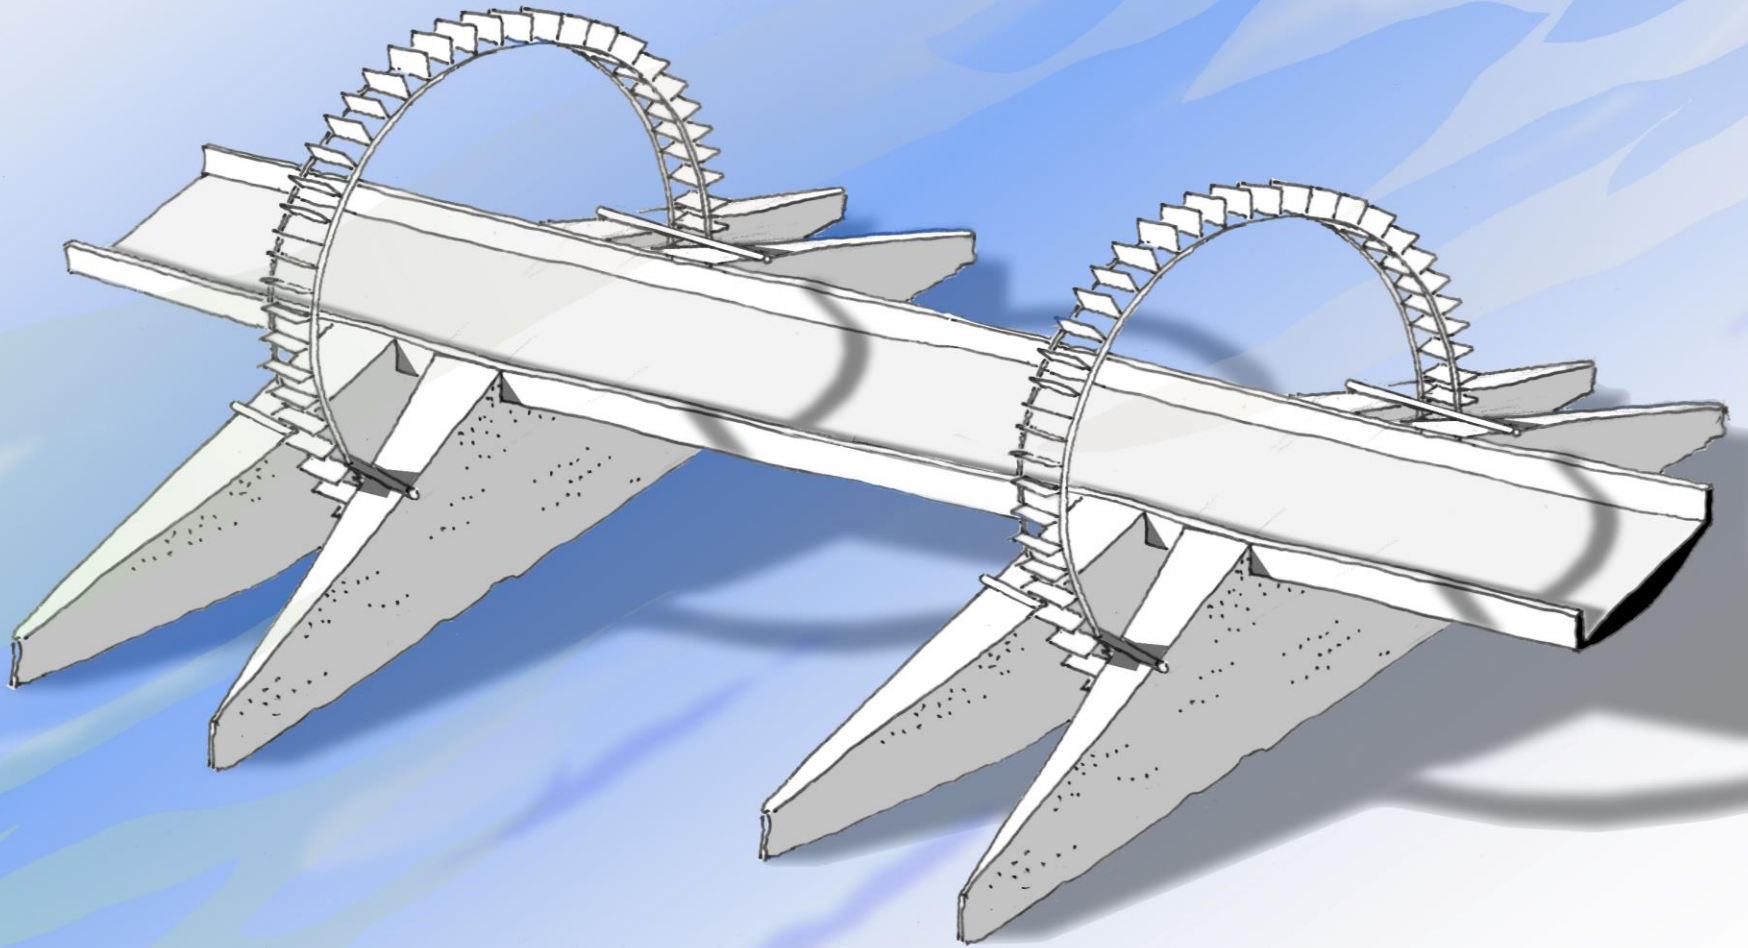

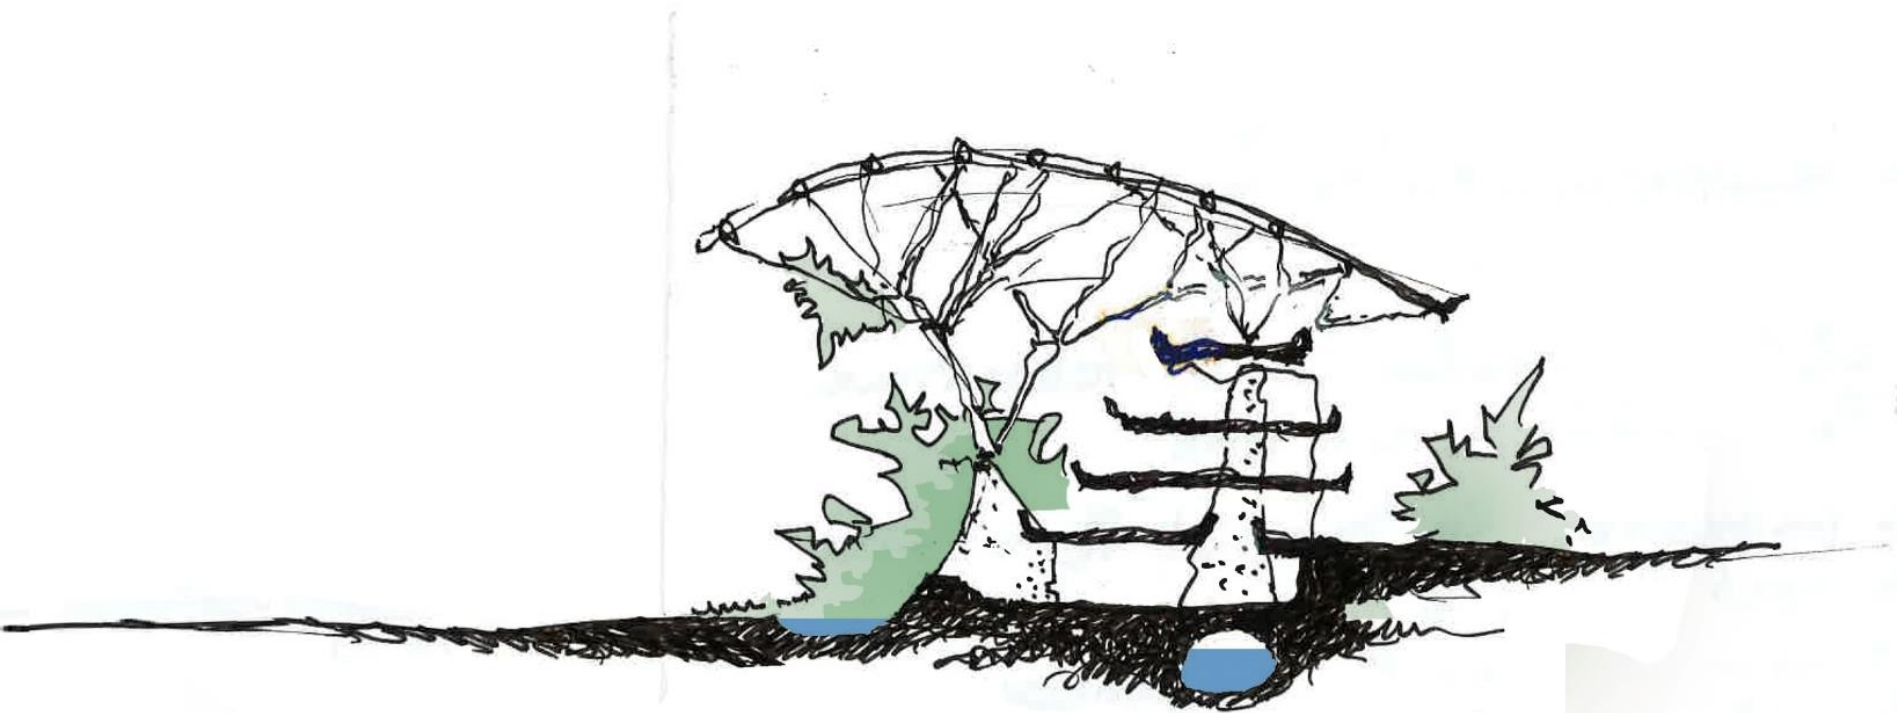

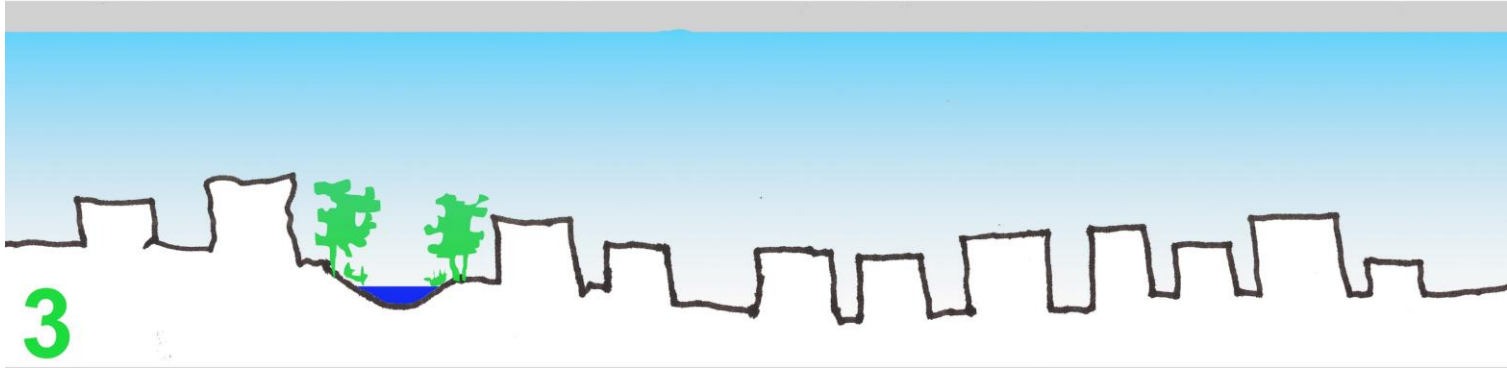

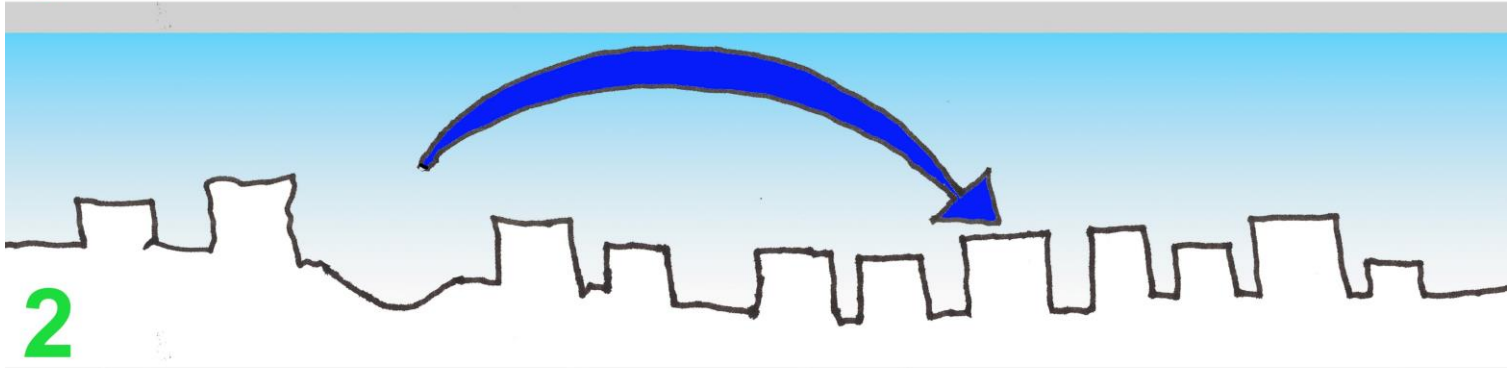

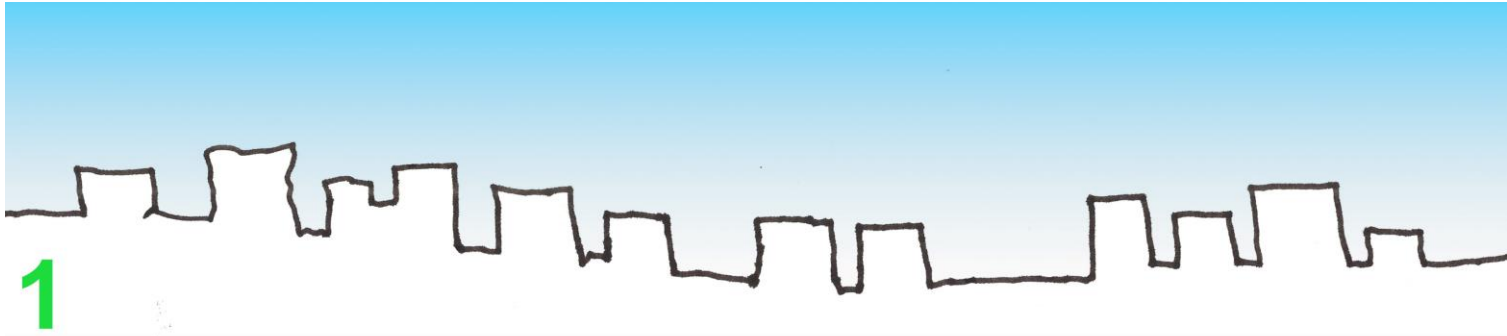

... sous une grande casquette ...

... en hommage à Hundertwasser...

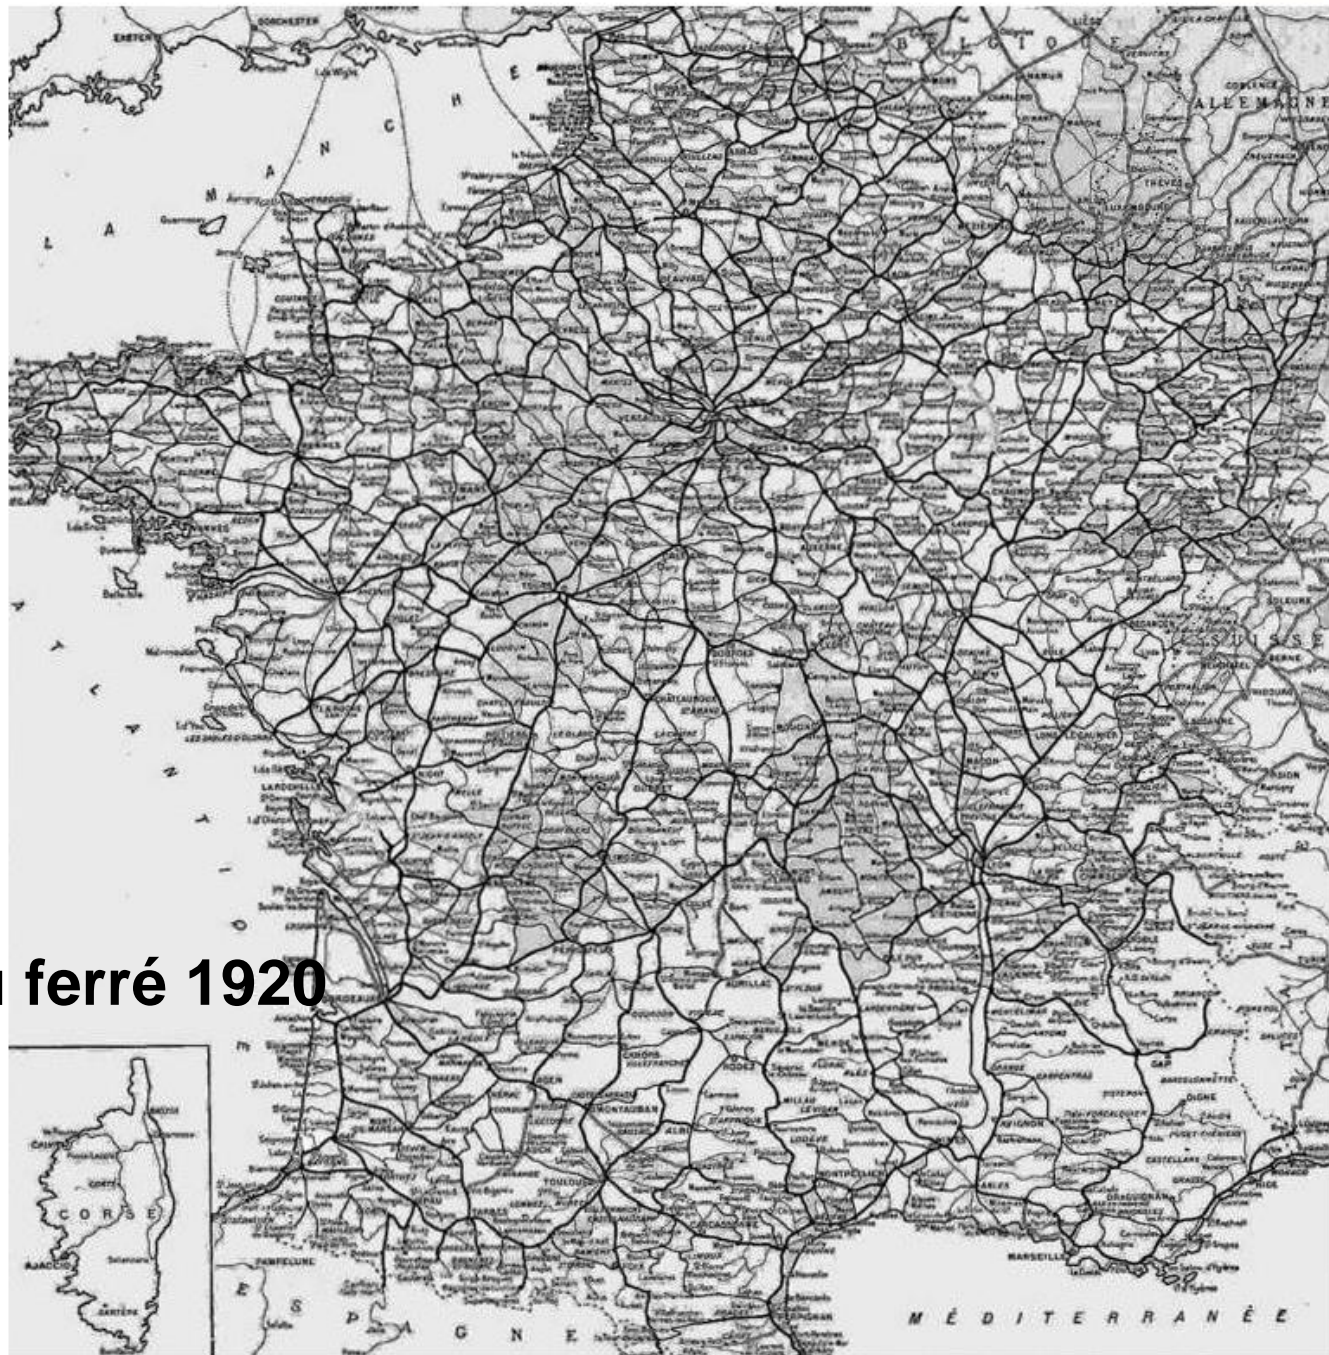

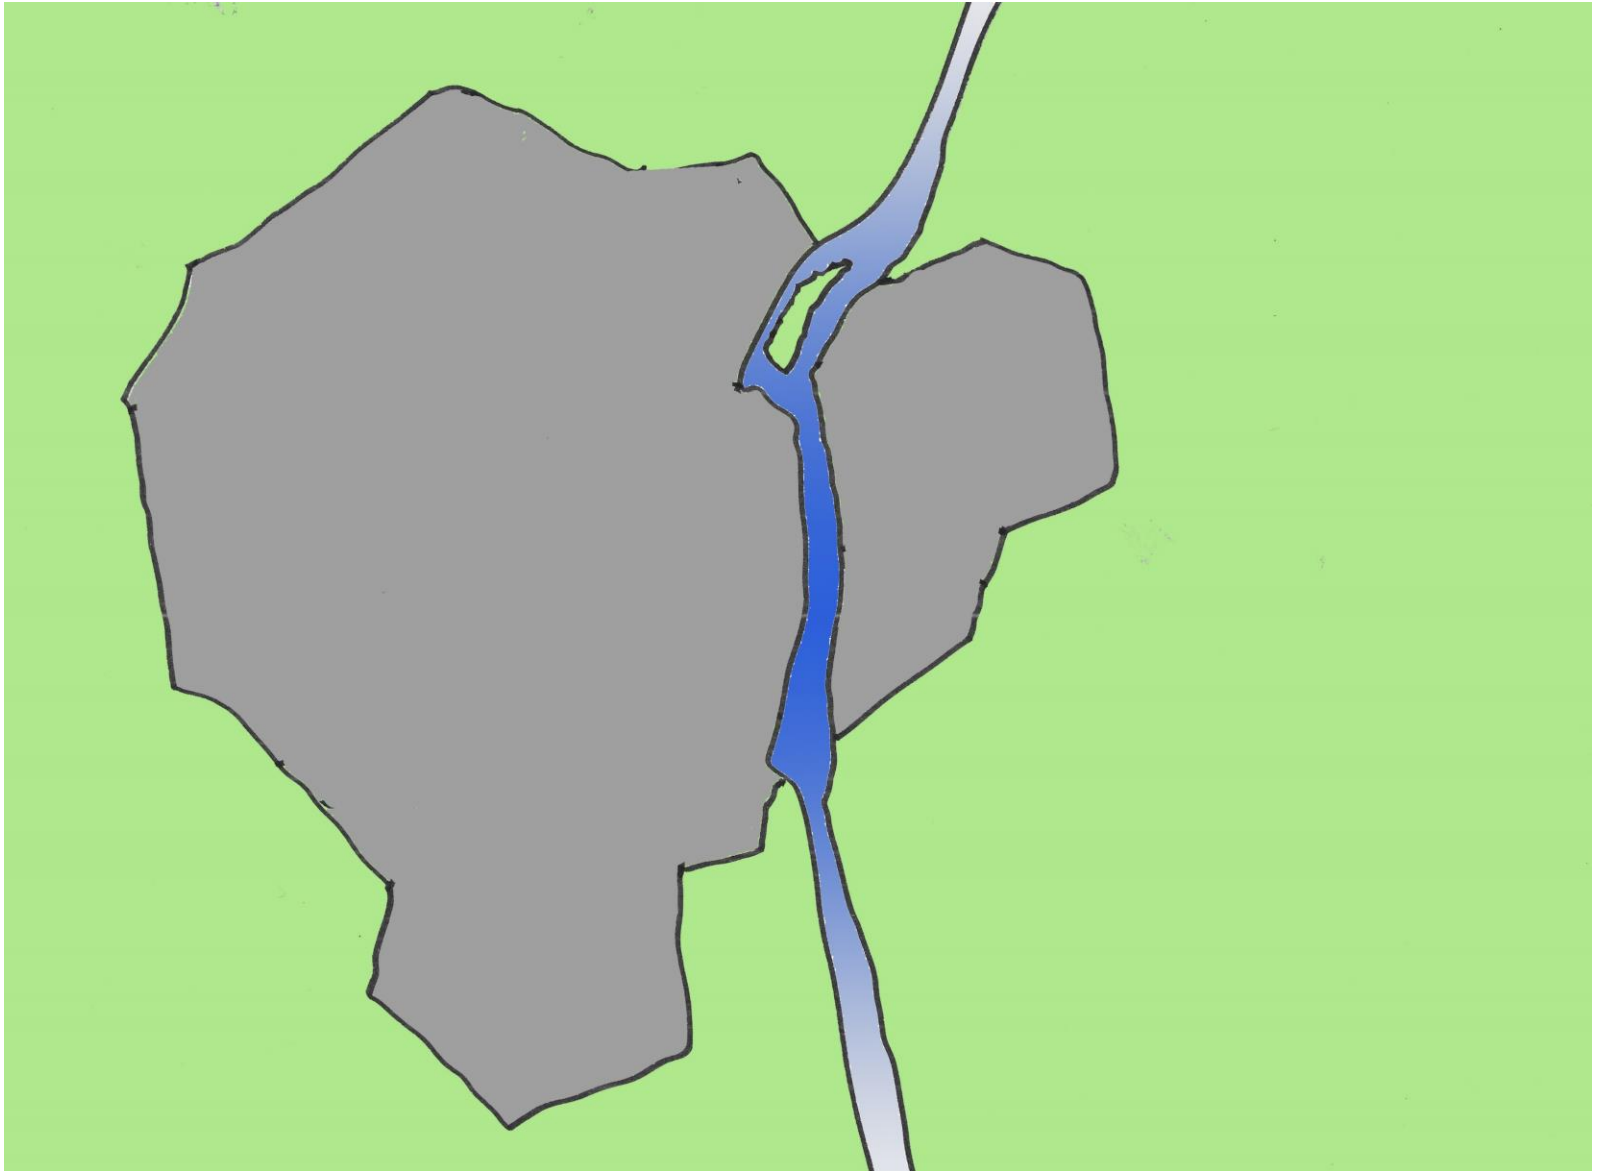

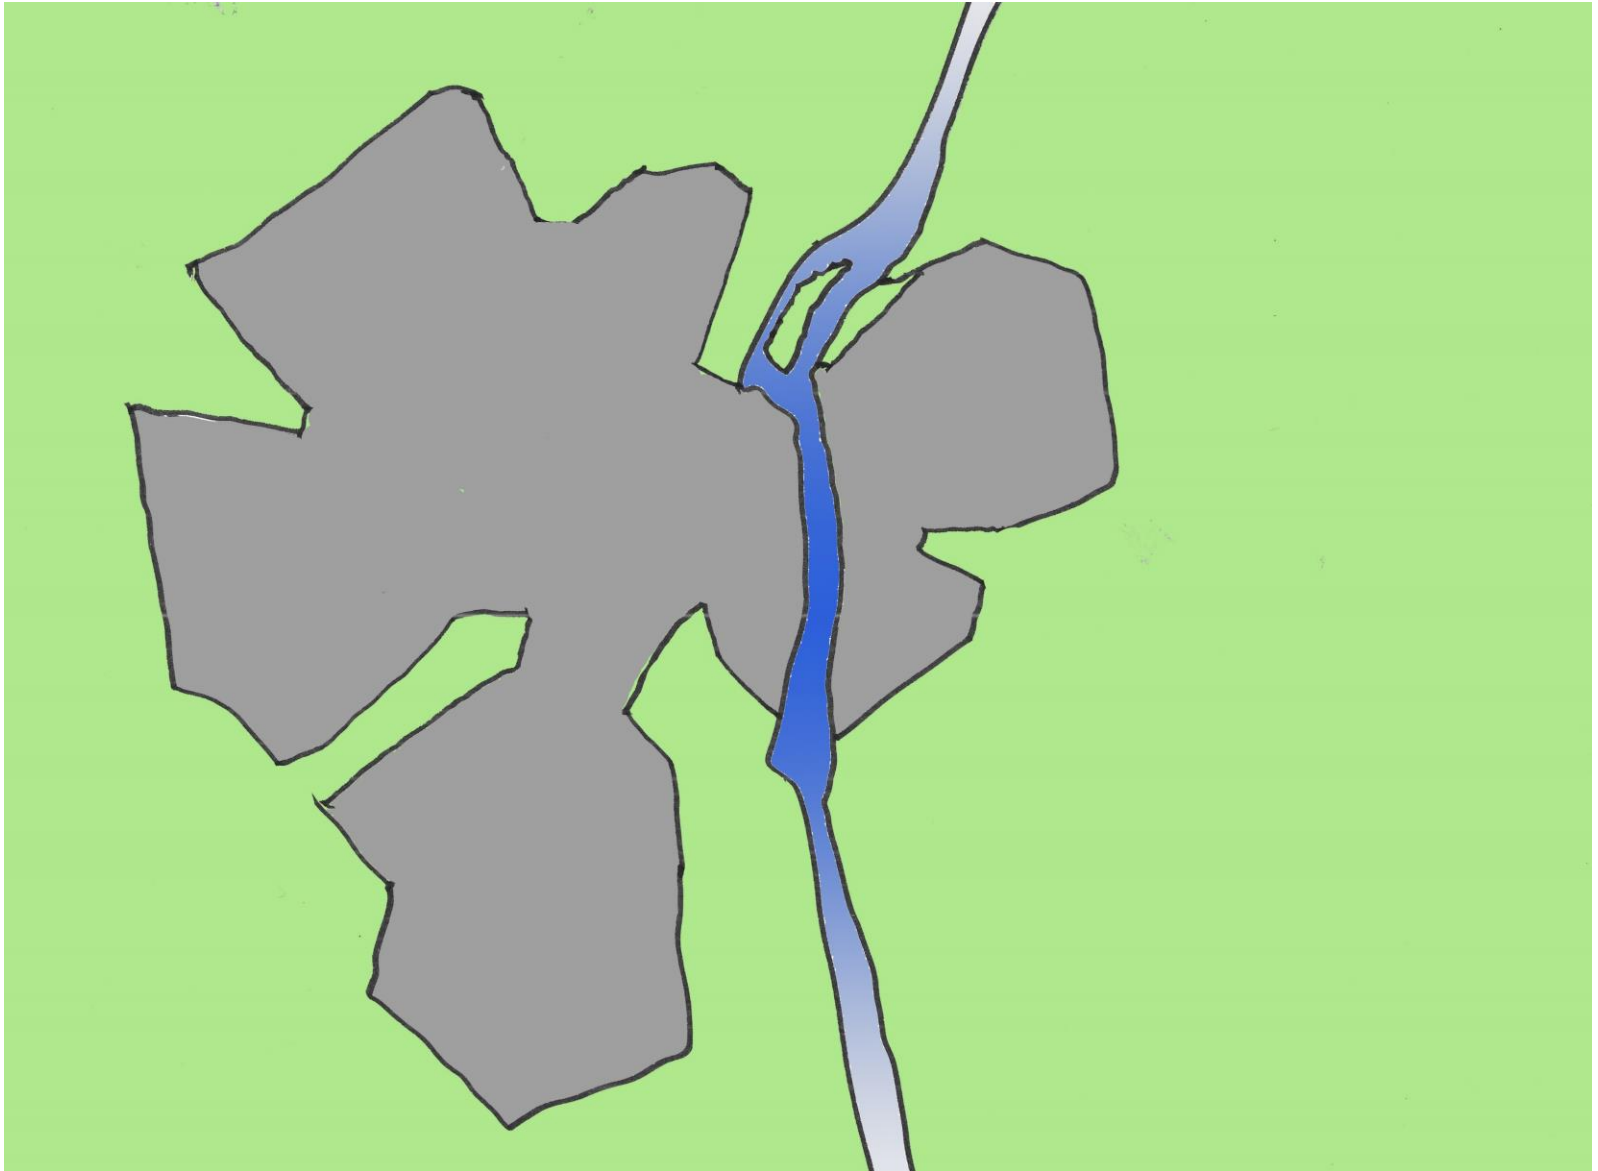

... bocages et forêts : bases de la ville fraîche ...

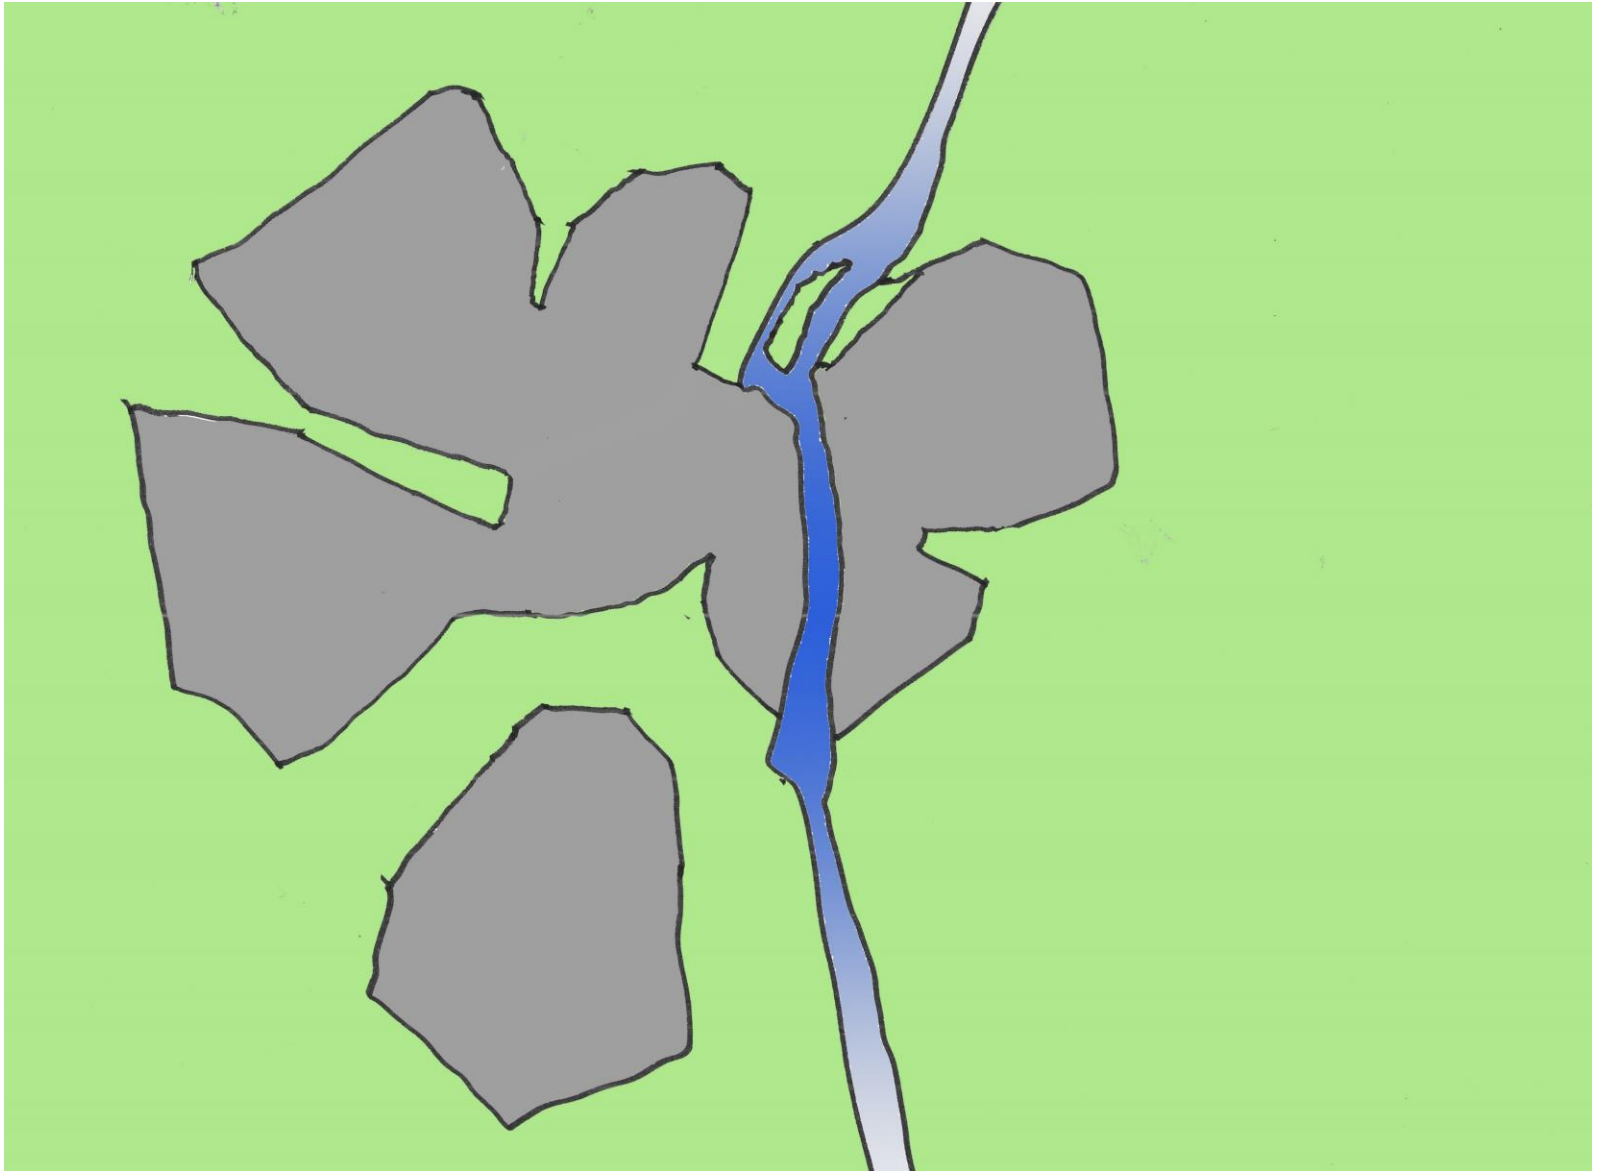

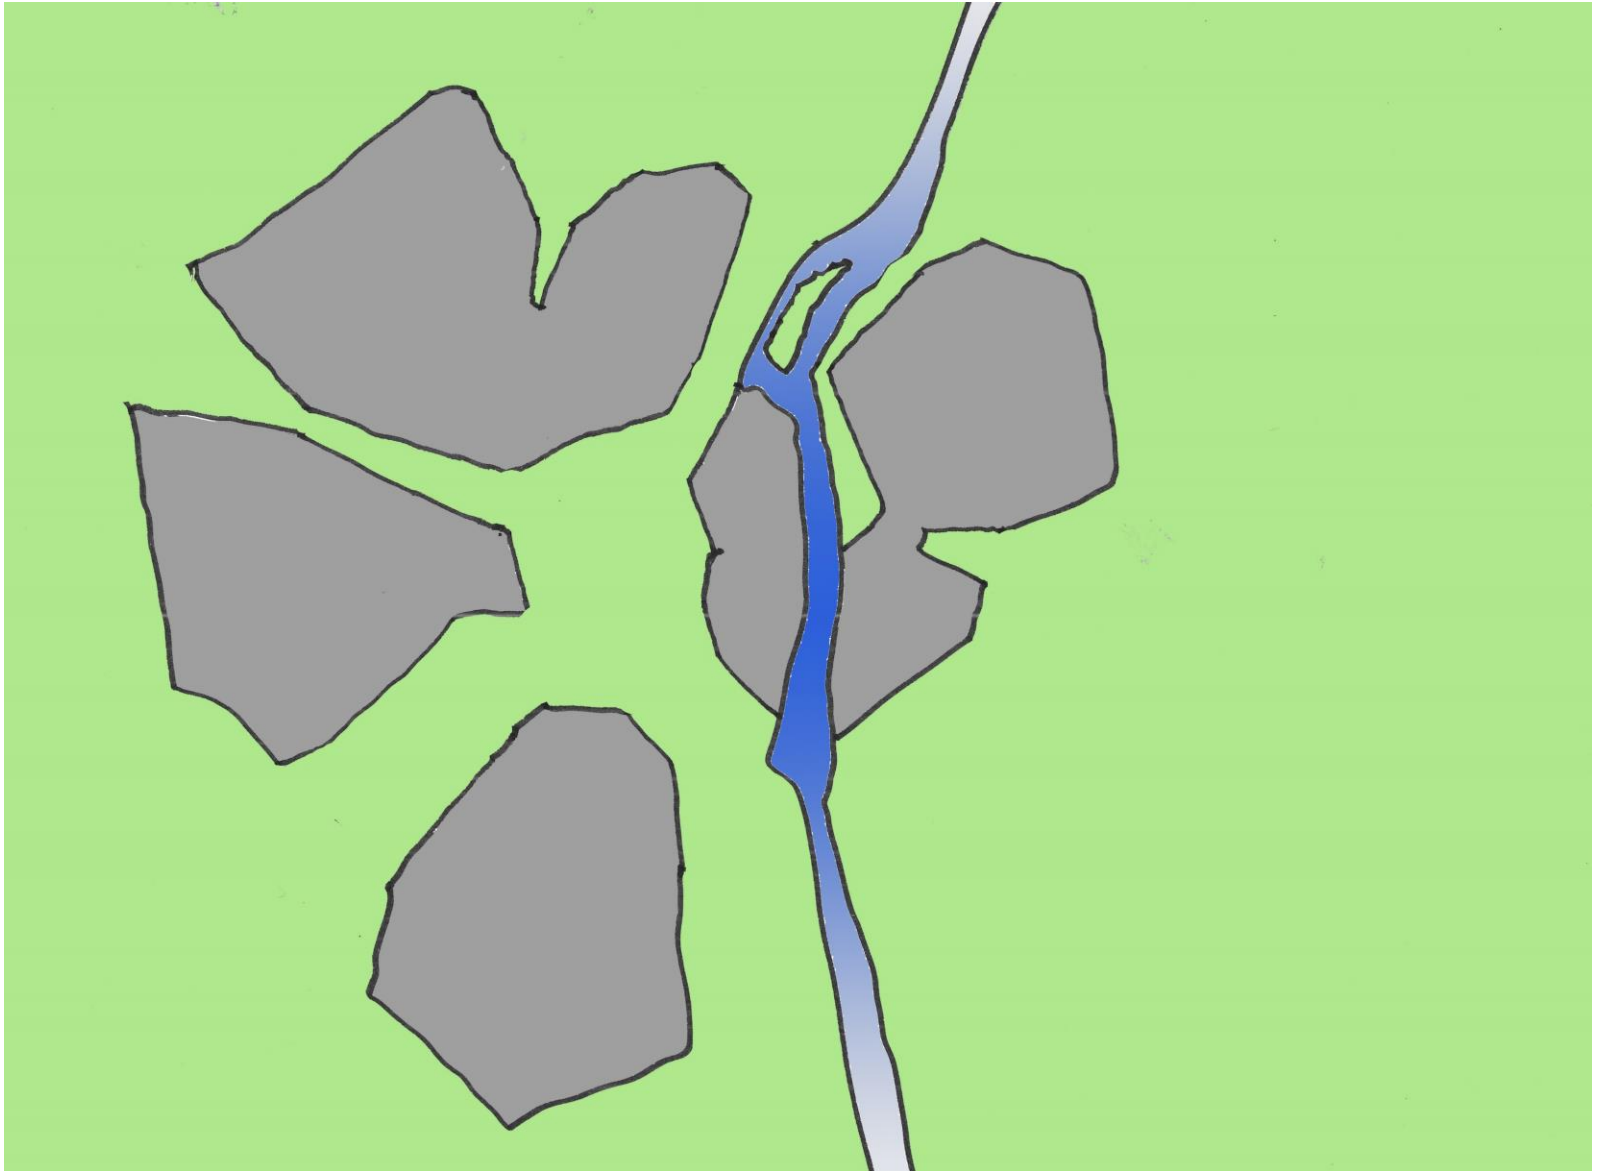

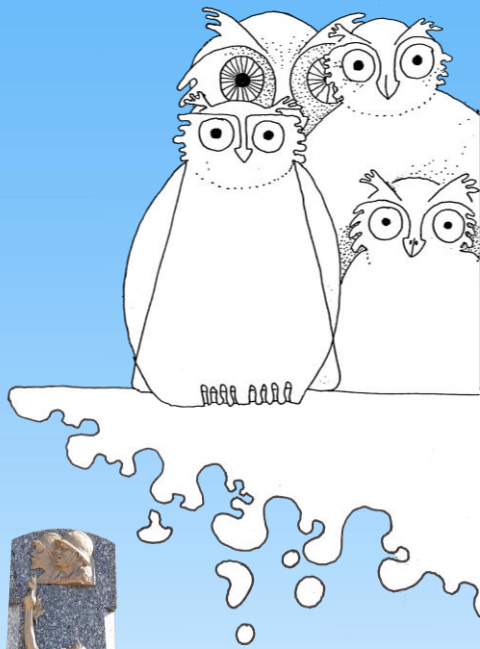

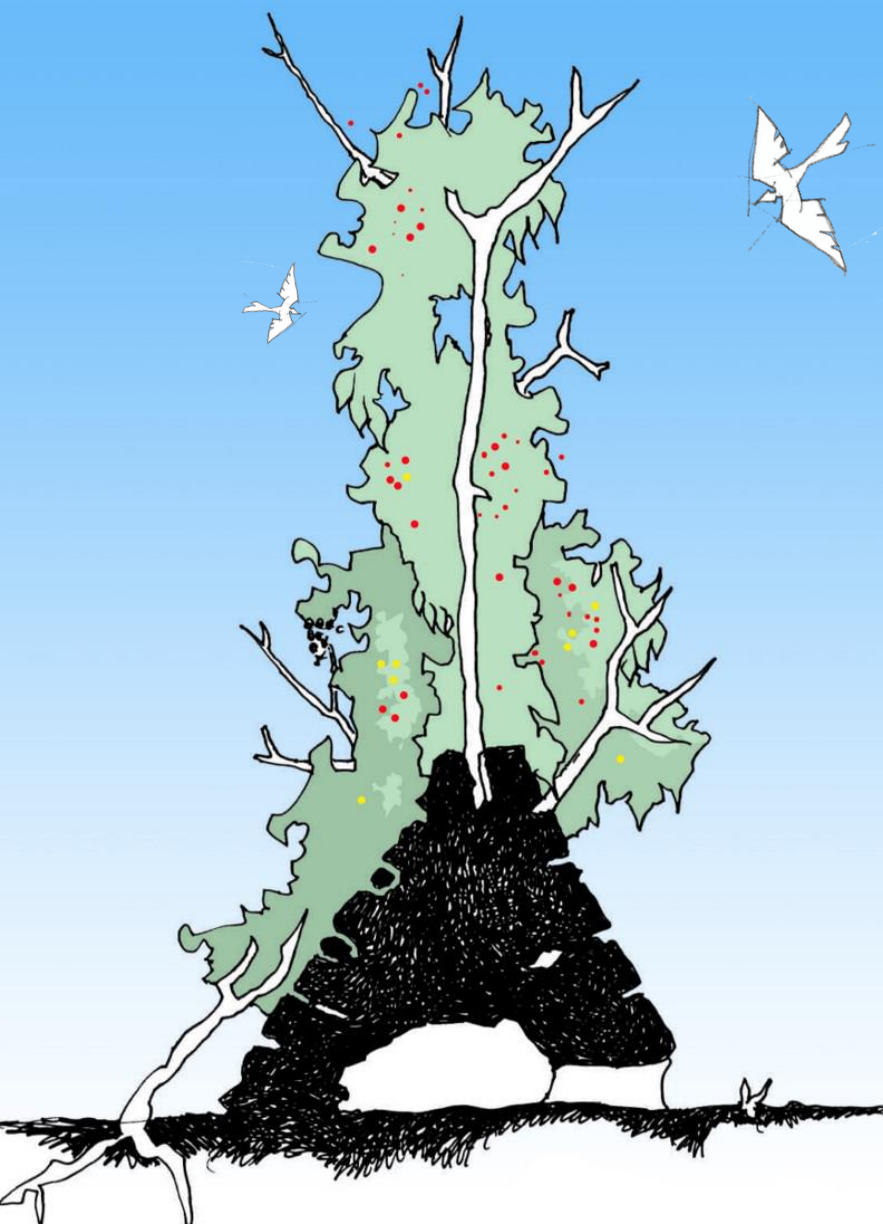

Réseau ferré 1920

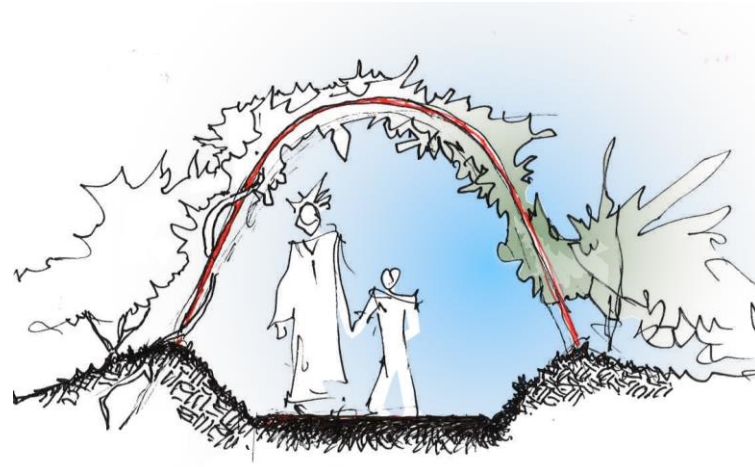

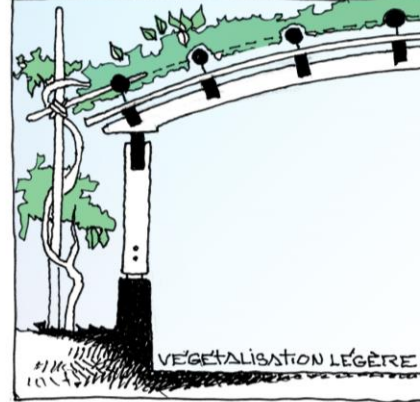

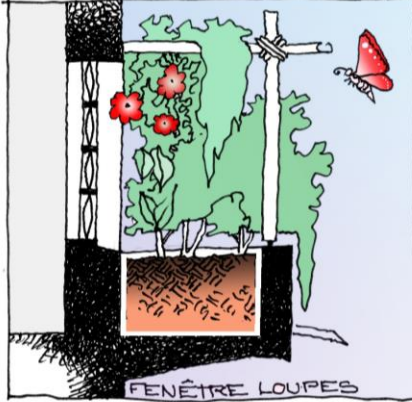

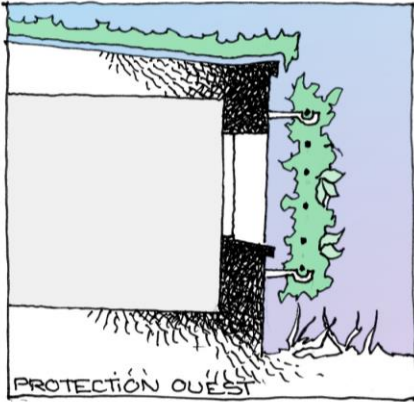

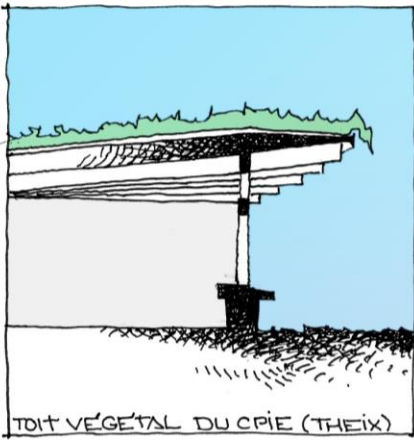

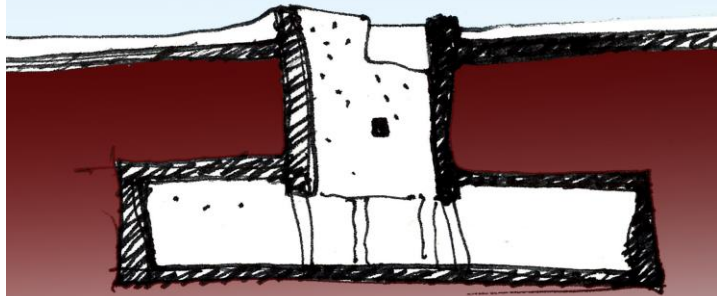

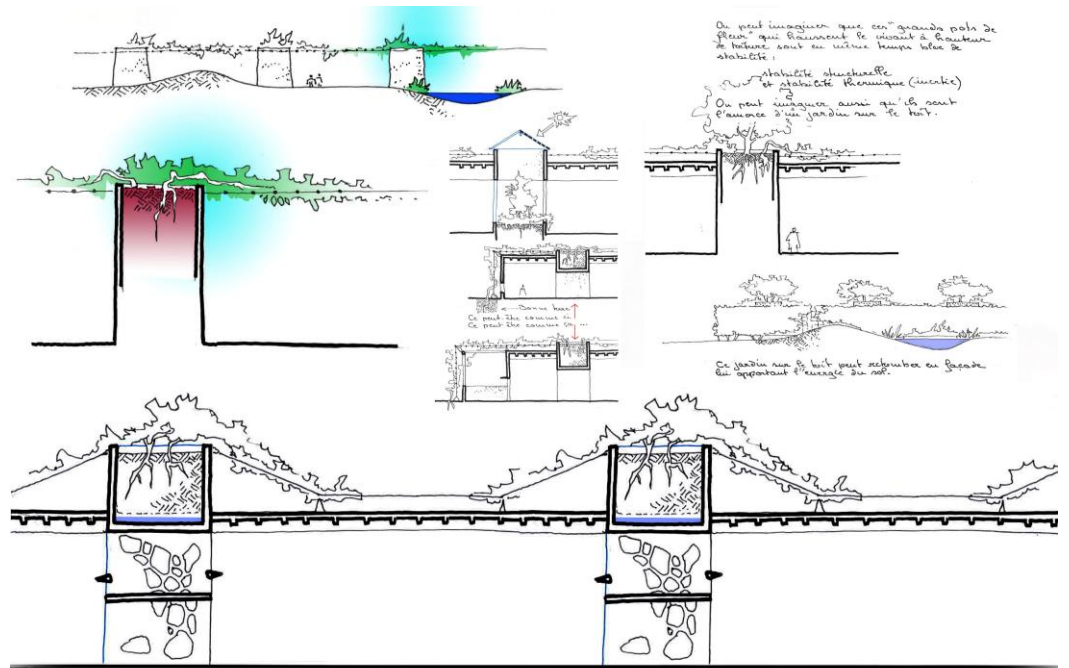

... une vraie cave, c'est 12° à 15° sans condenseur chaud, sans moteur ...

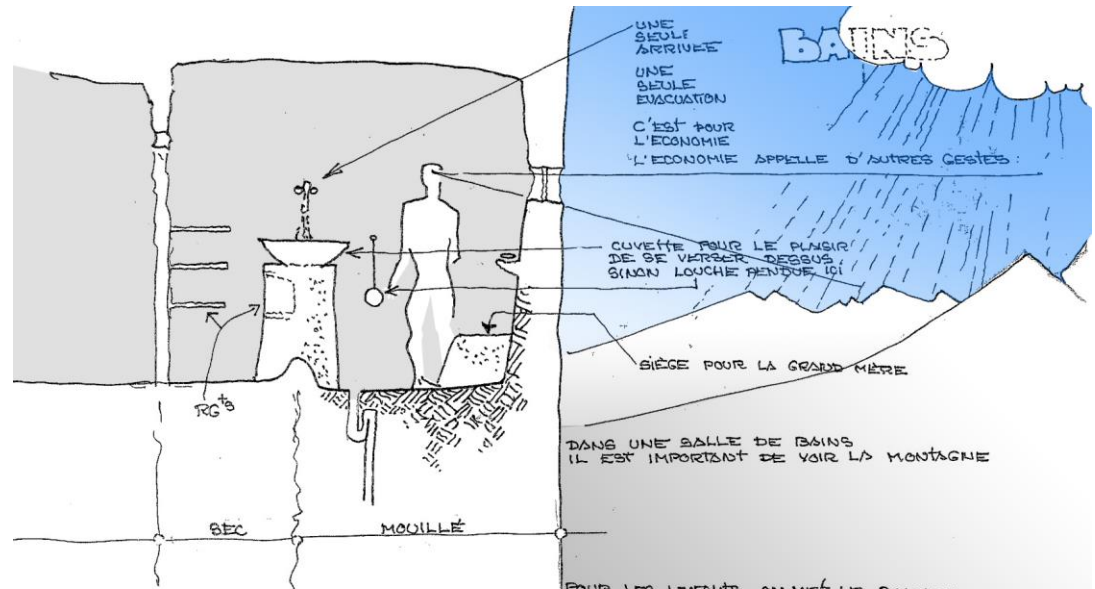

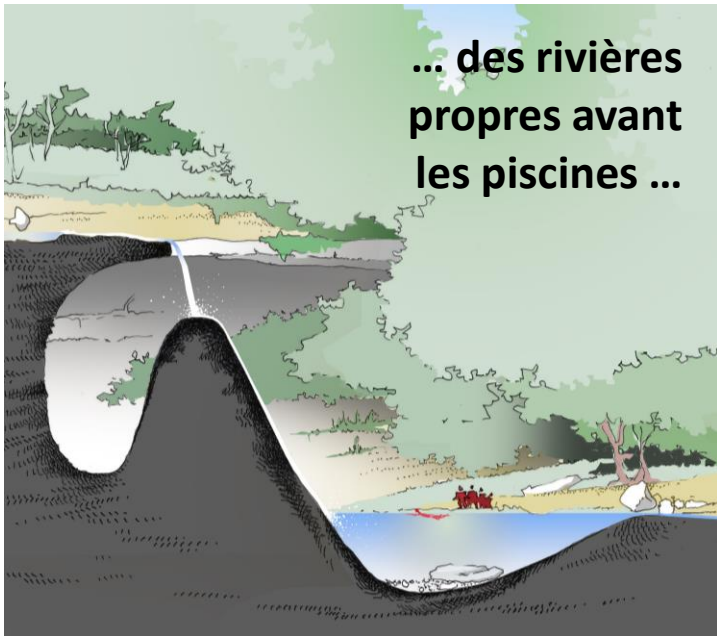

... habitat saharien ...

... ne pas travailler sous des tôles ...

... des rivières propres avant les piscines ...

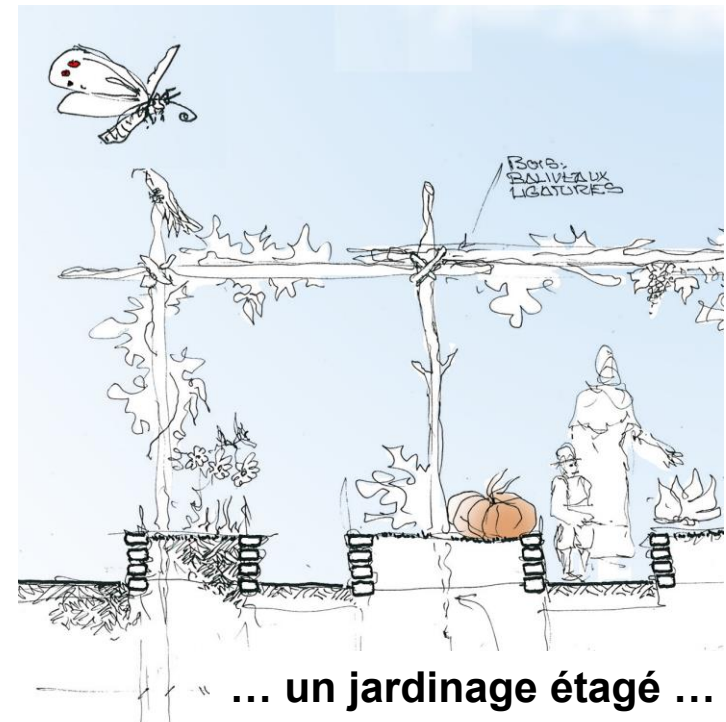

... des salles de bains avec moins de plomberie ...

... moins de métal...
... moins de plastique...

... charnières bois et poignées cailloux ...

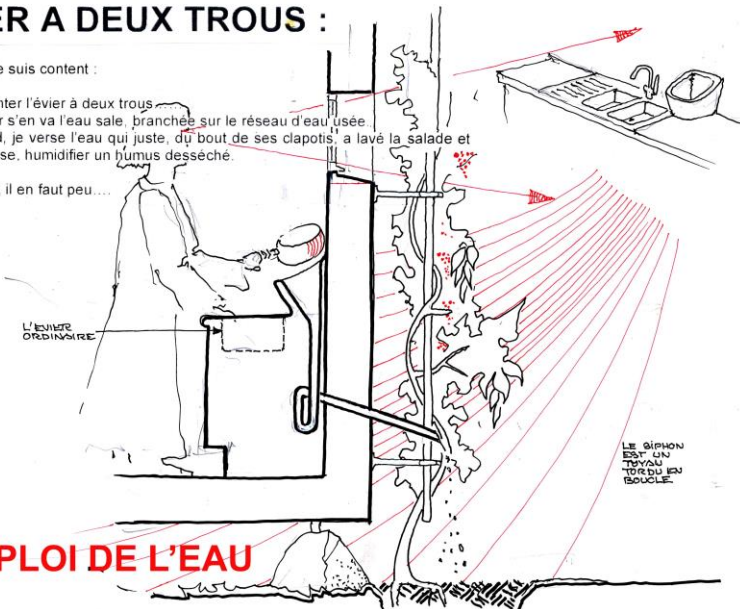

... un jardinage étagé ...

L'EVIER A DEUX TROUS :

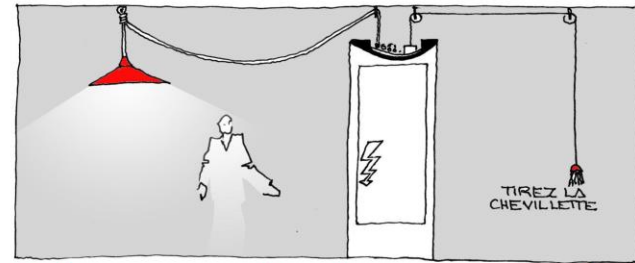

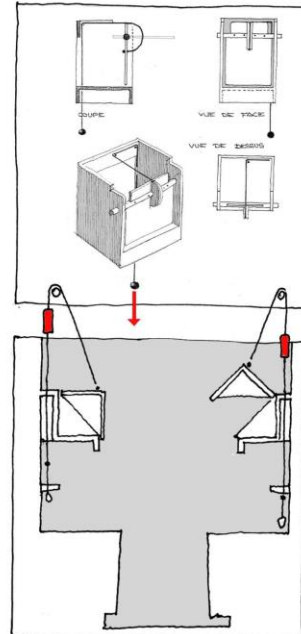

Il en faut peu, je suis content :

Je viens d'inventer l'évier à deux trous
Dans le premier s'en va l'eau sale, branchée sur le réseau d'eau usée.
Dans le second, je verse l'eau qui juste, du bout de ses clapotis, a lavé la salade et file ainsi, joyeuse, humidifier un humus desséché.

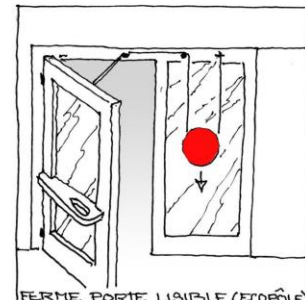

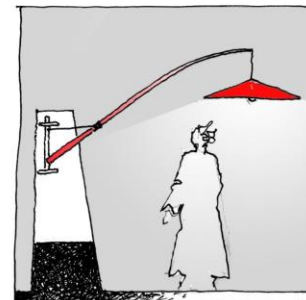

Je suis content, il en faut peu....

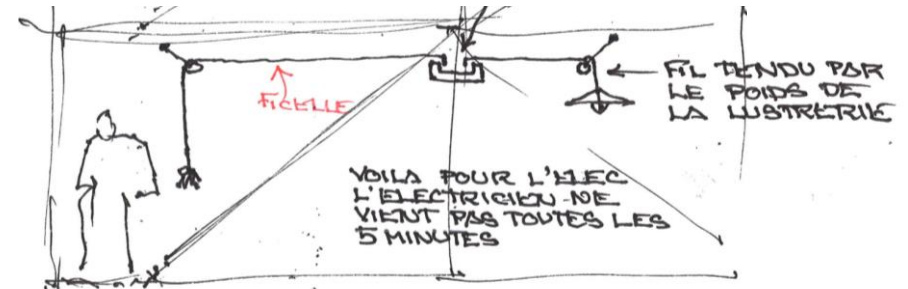

REEMPLOI DE L'EAU

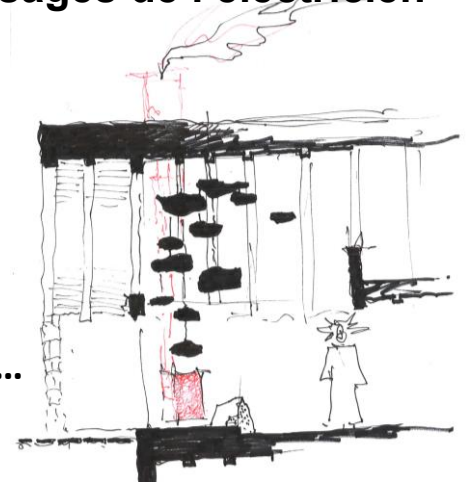

...des commandes à ficelle...!

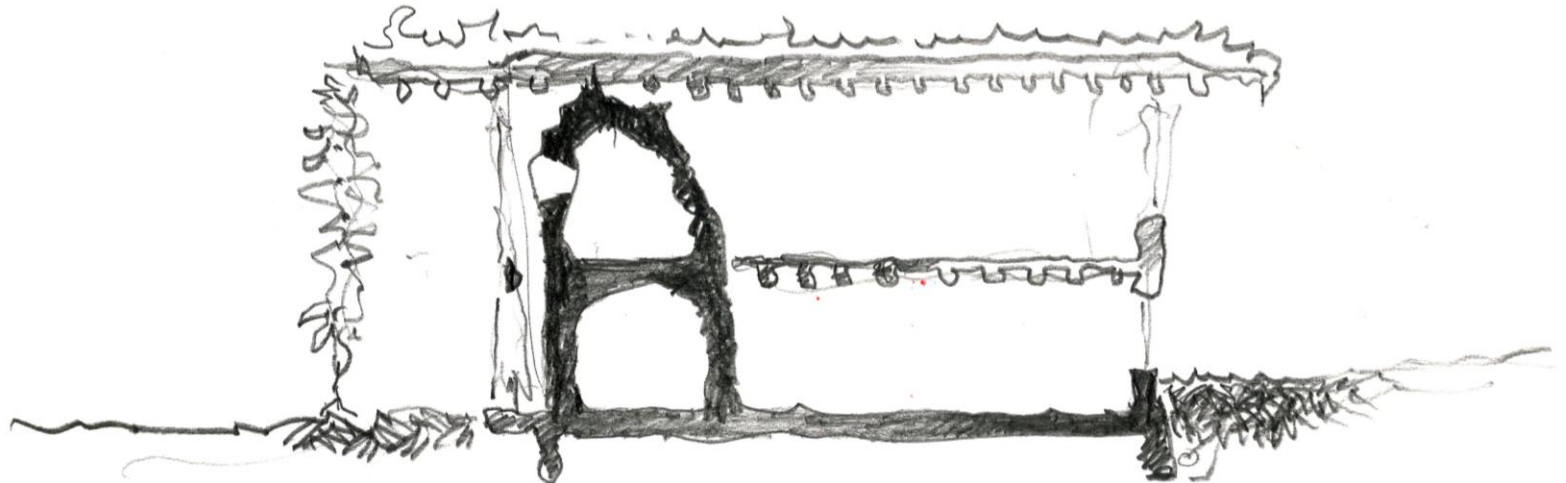

... réduire les passages de l'électricien sur le chantier ...

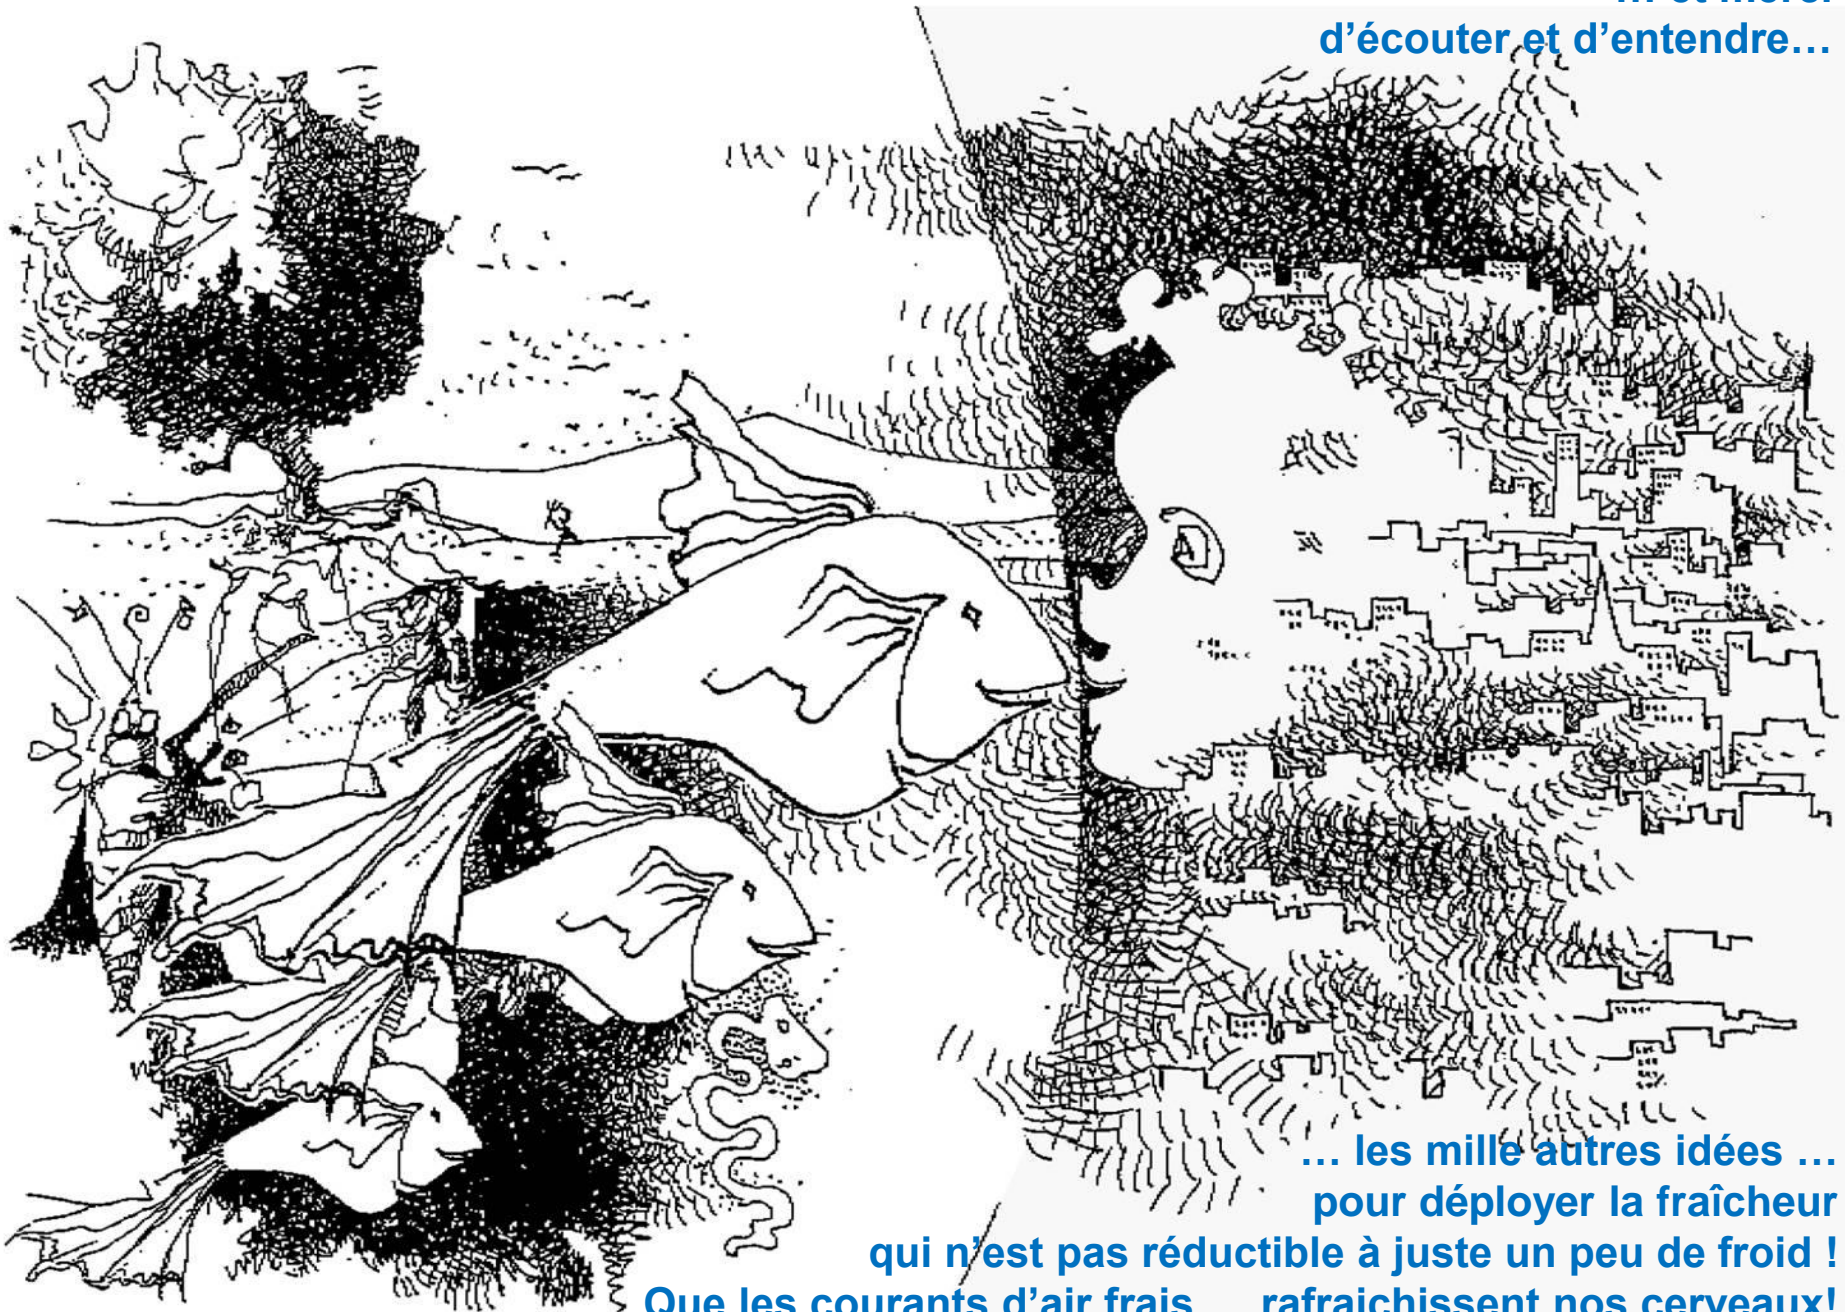

... pierres plantées ou pierres qui volent ...

... le lourd à l'intérieur pour amortir le chaud comme pour amortir le froid ...

... et merci
d'écouter et d'entendre...

... les mille autres idées ...
pour déployer la fraîcheur
qui n'est pas réductible à juste un peu de froid !
Que les courants d'air frais ... rafraichissent nos cerveaux!

Yves Perret
